## Effect Of Temperature On Gender

In many reptiles, environmental factors rather than chromosomes determine gender. In the Effect of Temperature on Gender Gizmo, students discover that, for reptiles such as the gecko, cool temperatures result in more female offspring, while warm temperatures result in more males. Students can compare these results to gender ratios in birds, which are not environmentally determined.

### How is the gender of some reptiles determined by temperature?

Temperature-dependent sex determination (TSD) is a type of environmental sex determination in which the temperatures experienced during embryonic/larval development determine the sex of the offspring. It is only observed in reptiles and teleost fish. TSD differs from the chromosomal sex-determination systems common among vertebrates. It is the most popular and most studied type of environmental sex determination (ESD).

The temperature of the developing eggs is what decides whether the offspring will be male or female. This is called temperature-dependent sex determination, or TSD. Research shows that if a turtle's eggs incubate below 81.86 Fahrenheit, the turtle hatchlings will be male.	<del>AlphaFold From DeepMind Will Change The World</del>	<u>Battle for the thermostat: Gender and the effect of ...</u>
