American College of Surgeons

Today our emergency care system  
faces an epidemic of crowded  
emergency departments, patients  
boarding in hallways waiting to  
be admitted, and daily  
ambulance diversions. Hospital-  
Based Emergency Care addresses  
the difficulty of balancing the  
roles of hospital-based  
emergency and trauma care, not  
simply urgent and lifesaving  
care, but also safety net care  
for uninsured patients, public

health surveillance, disaster  
preparation, and adjunct care in  
the face of increasing patient  
volume and limited resources.  
This new book considers the  
multiple aspects to the  
emergency care system in the  
United States by exploring its  
strengths, limitations, and  
future challenges. The wide  
range of issues covered  
includes: • The role and impact  
of the emergency department  
within the larger hospital and  
health care system. • Patient  
flow and information technology.  
• Workforce issues across  
multiple disciplines. • Patient  
safety and the quality and  
efficiency of emergency care  
services. • Basic, clinical, and  
health services research  
relevant to emergency care. •  
Special challenges of emergency  
care in rural settings. Hospital-  
Based Emergency Care is one of  
three books in the Future of  
Emergency Care series. This book  
will be of particular interest  
to emergency care providers,  
professional organizations, and  
policy makers looking to address  
the deficiencies in emergency  
care systems.

Chapters in this volume range from epidemiology and pathological mechanisms of injury, and neuroprotection to long-term outcomes with a strong emphasis on current neurobiological approaches to describing the consequences and mechanisms of recovery from TBI. The book presents contemporary investigations on blast injury and chronic traumatic encephalopathy, making this state-of-the-art volume a must have for clinicians and researchers concerned with the clinical management, or investigation, of TBI. Internationally renowned scientists describe cutting edge research on the neurobiological response to traumatic brain injury, including descriptions of potential biomarkers and indicators of potential targets for treatments to reduce the impact of the injury. The purpose of this book is to give providers of all levels a simple and essential source of practical information in treating the elderly trauma and emergency surgery patient. The Introduction instructs practitioners how to evaluate and assess risk including frailty and use this information in Goals of Care discussions to facilitate shared decision making so crucial to this population. The individual chapters consist of best practices and care guidelines from some of the most well-known thought leaders and best trauma centers in the country across the spectrum from geriatricians to trauma and acute care surgeons and nurses. Each chapter contains easy-to-read algorithms and references that the readers can use and adapt for their own setting. Chapters on Pre-hospital care will help guide EMS organizations and even systems in the right care and triage of the elderly. Each chapter also contains a Nursing Focus section for helpful nursing tips in

caring for the elderly with those injuries and problems. These sections make this book a must-have for any center looking to improve its care of the elderly patient or just trying to be sure its care is already the best it can be. A special section on Post Acute Care will introduce the provider to the common issues surrounding particular disposition destinations for the elderly patient. This will facilitate discussions with families, case managers and facilities to help improve time to disposition.

"Injury accounts for a significant proportion of the world's burden of disease. Each year 5.8 million people die from injury and millions more are disabled. The response to this global health problem needs to include a range of activities, from better surveillance to more in-depth research, and primary prevention. Also needed are efforts to strengthen care of the injured. The World Health Organization (WHO) has responded to this need with a variety of actions. ... WHO collected this set of case studies, documenting success stories and lessons learned from several countries. Through this publication, WHO seeks to increase communication ... among those

working in the field of trauma care in different countries worldwide."--p. iii.

**Trauma Care Pre-Hospital Manual** National Academies Press

A formal training program with theoretical and practical components is essential for all emergency medical personnel involved in providing care for critically injured patients. Communication, effective first aid, and on time transportation to a health center play a major role in improving quality of care for critically injured patients. Using life experience examples, participants in the study emphasized the importance of each factor on the delivery of quality care for critically injured patients.

Recommendations based on the study findings included two main categories. The first category illustrated recommendations to stakeholders, and the second category reflected recommendations for further study. Stakeholders in this study included healthcare leaders in Afghanistan, healthcare professionals involved in providing health care in Afghanistan, and local people in Afghanistan. The modified van Kaam method in the qualitative phenomenological study involved conducting semistructured interviews,

which were audio-taped and transcribed. The rationale for using the phenomenological approach in the qualitative study was to describe in-depth experiences of health care professionals. Moustakas (1994) modified van Kaam method explored the lived experiences and perceptions of 17 doctors and nurses relating to emergency trauma care for critically injured patients. Data analysis revealed important factors that could enhance the quality of prehospital care for civilian casualties of landmine and unexploded ordnance (UXO) blast injuries in Afghanistan. The four major themes that emerged from participants responses to interview questions included communication, formal training for emergency medical personnel, transportation to a higher-level center, and quality of prehospital care.
