ELECTRICAL  
ENGINEERING IN  
CONTEXT: SMART

COMMUNICATIONS by  
bestselling author Roman Kuc  
describes the basic  
components and technologies  
that make today's computer-  
assisted systems operate and

cooperate, inviting the reader  
to understand by participating  
in the design process. Directed  
at the undergraduate electrical  
engineering student, this book  
starts with the basics and  
requires a working knowledge  
of algebra. Rather than simple  
plug-and-chug exercises, the  
book teaches sophisticated  
problem-solving and design  
tools. Students will learn  
through designing digital  
displays, extracting  
information from signals, and  
optimizing system  
performance through  
parameter value selection and

observing graphical data displays. Animations showing dynamic system behavior and relating to the book figures are available through the book's companion site. At the completion of the course, students will have an understanding of the capabilities of current digital devices and ideas for possible new applications. This will benefit students in other courses requiring quantitative skills and in their profession. To help accomplish this tall order, the book is written in a graduated intensity that can be

adapted to the specific needs and talents of each student: Basic commands and graphs are used in first-level problems that illustrate device performance while varying parameter values and in designs that are open-ended, driven by student curiosity. Some problems can be solved using software packages, but many exercises are for paper and pencil solution. MATLAB based examples and problems are also included for users comfortable with computer programming. Important Notice: Media content
