Tessensohn, European Intellectual Property Review The importance of intellectual property rights is now well established as a vital component in the success of firms and nations. The diverse contributors to this volume, drawn from the fields of law, business and economics, clarify and analyze the problems and promise of IP policy from a global perspective. They discuss both developed and emerging nations and advance the understanding of this increasingly important topic. The articles address issues from an interdisciplinary focus with an emphasis on current topical issues. Topics addressed include intellectual rights protection in emerging nations such as China, an exploration of a specific cross-national intellectual property perspective, strategies for protecting intellectual property rights, and a guide to understanding emerging and non-western legal systems. A mix of theoretical and practical observations helps the reader navigate the increasingly international topic of intellectual property as well as offers strategies for optimal utilization of intellectual property assets.

The volume serves well both as a solution-oriented book and as a tool for facilitating further discussion and analysis in the classroom. Scholars and students in law, business and economics, as well as business practitioners interested in a global perspective on IP policy, will enjoy this book.

This book examines the management of technical change in manufacturing and services through an explicit political-economic framework. It examines the management of automation in Britain and America since 1950, and it applies the same useful framework to explore the impact of Japanization on both Britain and the US in the 1980s and 1990s.

The field of electrical engineering is very innovative-new products and new ideas are continually being developed. Yet all these innovations are based on the fundamental principles of electrical engineering: Ohm's law, Kirchhoff's laws, feedback control, waveforms, capacitance, resistance, inductance, electricity, magnetism, current, voltage, power, energy. It is these basic fundamentals which are tested for in the Professional Engineering Examination (PE Exam). This text provides an organized review of the basic electrical engineering fundamentals. It is an outgrowth of an electrical engineering refresher course taught by the author to candidates preparing for the Professional Engineering Examination-a course which has enabled scores of electrical engineers in Minnesota and Wisconsin to successfully pass the PE Exam. The material is representative of the type of questions appearing in the PE Exams prepared by the National Council of

Engineering Examiners (NCEE) over the past twelve years. Each problem in the text has been carefully selected to illustrate a specific concept. Included with each problem is at least one solution. Although the solutions have been carefully checked, both by the author and by students, there may be differences of interpretation. Also, in some cases certain assumptions may need to be made prior to problem solution, and since these to individual, the final answer may also differ. The assumptions will vary from individual author has attempted to keep the requirements for assumptions and interpretation to a minimum.

Heterogeneous integration uses packaging technology to integrate dissimilar chips, LED, MEMS, VCSEL, etc. from different fabless houses and with different functions and wafer sizes into a single system or subsystem. How are these dissimilar chips and optical components supposed to talk to each other? The answer is redistribution layers (RDLs). This book addresses the fabrication of RDLs for heterogeneous integrations, and especially focuses on RDLs on: A) organic substrates, B) silicon substrates (through-silicon via (TSV)-interposers), C) silicon substrates (bridges),

D) fan-out substrates, and E) ASIC, memory, LED, MEMS, and VCSEL systems. The book offers a valuable asset for researchers, engineers, and graduate students in the fields of semiconductor packaging, materials sciences, mechanical engineering, electronic engineering, telecommunications, networking, etc.
