The field of
electrical
engineering is very
innovative-new
products and new
ideas are continu
ally being
developed. Yet all
these innovations
are based on the
fundamental
principles of
electrical
engineering: Ohm's
law, Kirchhoff's
laws, feedback
control, waveforms,
capacitance,
resistance,
inductance,
electricity,
magnetism, current,
voltage, power,

energy. It is these
basic fundamentals
which are tested for
in the Professional
Engineering
Examination (PE
Exam). This text
provides an
organized review of
the basic electrical
engineering
fundamentals. It is
an outgrowth of an
electrical
engineering
refresher course
taught by the author
to candidates
preparing for the
Professional
Engineering
Examination-a
course which has
enabled scores of
electrical engineers
in Minnesota and
Wisconsin to
successfully pass the
PE Exam. The
material is

representative of the
type of questions
appearing in the PE
Exams prepared by
the National Council
of Engineering
Examiners (NCEE)
over the past twelve
years. Each problem
in the text has been
carefully selected to
illustrate a specific
concept. Included
with each problem
is at least one
solution. Although
the solutions have
been carefully
checked, both by the
author and by
students, there may
be differences of
interpretation. Also,
in some cases
certain assumptions
may need to be
made prior to
problem solution,
and since these to
individual, the final

answer may also differ. The assumptions will vary from individual author has attempted to keep the requirements for assumptions and interpretation to a minimum.

Heterogeneous integration uses packaging technology to integrate dissimilar chips, LED, MEMS, VCSEL, etc. from different fabless houses and with different functions and wafer sizes into a single system or subsystem. How are these dissimilar chips and optical components supposed to talk to each other? The answer is redistribution layers (RDLs). This book

addresses the fabrication of RDLs for heterogeneous integrations, and especially focuses on RDLs on: A) organic substrates, B) silicon substrates (through-silicon via (TSV)-interposers), C) silicon substrates (bridges), D) fan-out substrates, and E) ASIC, memory, LED, MEMS, and VCSEL systems. The book offers a valuable asset for researchers, engineers, and graduate students in the fields of semiconductor packaging, materials sciences, mechanical engineering, electronic engineering, telecommunications, networking, etc.

This book examines the management of technical change in manufacturing

and services through an explicit political-economic framework. It examines the management of automation in Britain and America since 1950, and it applies the same useful framework to explore the impact of Japanization on both Britain and the US in the 1980s and 1990s.
