U.S. Industrial Directory Drawn & Quarterly Celebrating the twentieth anniversary of the King-Cat zine Never before have so few lines conveyed such a wealth of meaning as in John Porcellino's quietly riveting book about memory, relationships, and selfhood. During a period of isolation following a divorce, Porcellino penned Map of My

Heart, endowing it with the sensitivity and emotional depth so characteristic to his minimalist style. His tender drawings and spacious panels shape an autobiographical testimony where no moment is too small or insignificant for posterity. Pensive walks in the forest, encounters with rogue woodland creatures, school yard fights, Zen meditations, long lost crushes, and childhood exploits are the heart of this therapeutic account of the ever-fleeting present.

Paved roads constitute a major category of PM-10 and PM-2.5 emissions in urban areas. Paved roadway resuspension processes emit antiskid materials, abraded pavement particles, rubber tire fragments, and dirt that is tracked from unpaved areas. In the Denver area, exceedances of the PM-10 standard in late winter and early spring are related to residual road sand loadings

from wintertime antiskid controls. This report presents the results of research, sponsored by the Colorado Department of Transportation, to (a) determine the relationships between the paved roadway surface dust characteristics and fine particle emissions, and (b) evaluate emission control measures that reduce road surface silt loadings (either by preventive or mitigative means). Several types of field studies were used in performing this research. The Correlation Studies entailed simultaneous paved road plume profiling and road surface material sampling at three test sites in the Denver metropolitan area. The composition of collected airborne and surface samples were analyzed by chemical and microscopic analysis. The upwind/downwind

airborne particulate matter samples that were selected for analysis included PM-10 and PM-2.5, while the road surface samples included the resuspended PM-10 and PM-2.5 from Midwest Research Institute's Dustiness Test Chamber. The Correlation Studies demonstrated that emission control effectiveness for the paved road resuspension processes can be evaluated in terms of reductions of roadway surface material loadings. Additional composite surface sampling of Denver arterial roadways compared the effects of winter sanding and alternative chemical deicers on surface loadings.
