Does the identification number 60 indicate a toxic substance or a flammable solid, in the molten state at an elevated temperature? Does the identification number 1035 indicate ethane or butane? What is the difference between natural gas transmission pipelines and natural gas distribution pipelines? If you came upon an overturned truck on the highway that was leaking, would you be able to identify if it was hazardous and know what steps to take? Questions like these and more are answered in the Emergency Response Guidebook. Learn how to identify symbols for and vehicles carrying toxic, flammable, explosive, radioactive, or otherwise harmful substances and how to respond once an incident involving those substances has been identified. Always be prepared in situations that are unfamiliar and dangerous and know how to rectify them. Keeping this guide around at all times will ensure that, if you were to come upon a transportation situation involving hazardous substances or dangerous goods, you will be able to help keep others and yourself out of danger. With color-

"This Guide presents comprehensive, step-by-step guidance on assessing hazardous materials emergency response needs at state, regional, and local levels; matching state, regional, and local capabilities with potential emergencies involving different types of hazardous materials; and assessing how quickly resources can be brought to bear in an emergency. The methodology described in the Guide is designed to be scalable, allowing the implementation results to be aggregated at the local level up through regional, state, and national levels. Also, the Guide is designed to connect as many components as possible to already-established standards, guidelines, regulations, and laws, so that the Guide will remain current as these underlying components are updated. In addition, the Guide discusses appropriate means for maintaining currency of the information over time. The Guide and accompanying spreadsheet tool (on the attached CD-ROM), which leads planners through the assessment process, will be most useful for local jurisdictions that have limited resources and expertise in hazardous materials emergency response planning."--Publisher's description.

From extreme weather events such as Superstorm Sandy, man-made tragedies like the Madrid train bombings, the threat of bioterrorism, and emerging infections such as the H1N1 pandemic flu, disasters are creating increasingly profound threats to health of populations around the globe. Through a presentation of 16 case studies of events from natural disasters to pandemic infection, the authors examine the broad range of public health scenarios through the lens of emergency preparedness and planning. This text demonstrates the application of public health preparedness competencies established by the Association of Schools of Public Health (ASPH). It is designed for students across a wide spectrum of health and safety disciplines, and makes an ideal complement to any text on disaster preparedness or public health leadership, or can be used as a standalone text. --

Evidence-Based Practice for Public Health Emergency Preparedness and Response Auerbach Publications

Intensely practical and down to earth, this timely new text covers the breadth of health emergency preparedness, resilience and response topics in the context of inter-disciplinary and whole society responses to a range of threats. It includes public, private and third sector roles in preparation for and in response to natural and man-made events, such as: major incident planning; infectious disease epidemics and pandemics; natural disasters; terrorist threats; and business and service continuity management. The book builds upon the basics of risk assessment and writing an emergency plan, and then covers inter-agency working, command and control, communication, personal impact and business continuity as well as training, exercises and post-incident follow up. Detailing the full emergency preparedness and civil protection planning cycle, the book is illustrated throughout with real-life examples and case studies from global experts in the field for countries with both advanced and developing healthcare systems. This practical handbook

covering the essential aspects of major incident and disaster management is ideal for undergraduate and master's students in emergency management and public health, as well as for practitioners in emergency preparedness and civil protection. It will be valuable to all health practitioners from ambulance, hospital, primary and community care, mental health and public health backgrounds.

When communities face complex public health emergencies, state local, tribal, and territorial public health agencies must make difficult decisions regarding how to effectively respond. The public health emergency preparedness and response (PHEPR) system, with its multifaceted mission to prevent, protect against, quickly respond to, and recover from public health emergencies, is inherently complex and encompasses policies, organizations, and programs. Since the events of September 11, 2001, the United States has invested billions of dollars and immeasurable amounts of human capital to develop and enhance public health emergency preparedness and infrastructure to respond to a wide range of public health threats, including infectious diseases, natural disasters, and chemical, biological, radiological, and nuclear events. Despite the investments in research and the growing body of empirical literature on a range of preparedness and response capabilities and functions, there has been no national-level, comprehensive review and grading of evidence for public health

---

emergency preparedness and response practices comparable to those utilized in medicine and other public health fields. Evidence-Based Practice for Public Health Emergency Preparedness and Response reviews the state of the evidence on PHEPR practices and the improvements necessary to move the field forward and to strengthen the PHEPR system. This publication evaluates PHEPR evidence to understand the balance of benefits and harms of PHEPR practices, with a focus on four main areas of PHEPR: engagement with and training of community-based partners to improve the outcomes of at-risk populations after public health emergencies; activation of a public health emergency operations center; communication of public health alerts and guidance to technical audiences during a public health emergency; and implementation of quarantine to reduce the spread of contagious illness.

### Comprehensive Emergency Management for Local Governments:

Jones & Bartlett Publishers

Schools of public health act as a resource by providing expertise to strengthen our nation's emergency response systems. In response to the Pandemic and All Hazards Preparedness Act (PAHPA), there is an immediate and critical need to define research priorities for the Centers for Public Health Preparedness (CPHP) at schools of public health. It is because of this crucial need, that the Institute of Medicine (IOM) convened an ad hoc committee, conducted a fast-track study, and issued the book entitled Research Priorities in Emergency Preparedness and Response for Public Health Systems. The book defines a set of near-term research priorities for emergency preparedness and

response in public health systems. These priorities will be used by the Coordinating Office for Terrorism Preparedness and Emergency Response (COPTER) to help develop a research agenda that will in turn be used to inform research funding opportunity announcements. After considering the information presented during the public meeting and workshop and based on its expert judgment, the committee identified four priority areas for research that represent specific important aspects of systems of public health preparedness. The four areas are: enhancing the usefulness of training; improving timely emergency communications; creating and maintaining sustainable response systems; and generating effectiveness criteria and metrics.

**EPA's Response to 9/11 and Lessons Learned for Future Emergency Preparedness** Springer Publishing Company

In a changing world of fad and fashion, the humanitarian impulse is an enduring quality. This impulse was present in the aftermaths of the Rwandan genocide, Hurricane Katrina, the Indian Ocean tsunami, and the January 2010 earthquake in Haiti. The first principle of humanitarian assistance is "do no harm." The second might be, "do better!" Enter the evaluation of emergency and disaster management. The route from donor to affected population is long and varied. When sudden, unprecedented needs are juxtaposed with exceptional levels of charitable responses, the question is whether the responses were good enough. Did supply meet demand? Was it the right thing? Was it done well? Who received support? Was it appropriate? Was the timing right? Can it be improved? All are questions for evaluation. This issue of *New Directions* for evaluation consolidates reflections from evaluation practices in disaster and emergency management. A number of important themes are addressed: the systematic assessment of

needs, interagency coordination, and evaluating response in real time, in both international and national jurisdictions. The chapters discuss where the evaluation of humanitarian practice and emergency and disaster management currently stands, and where it should be going. For populations traumatized by disaster, these answers have consequences for protection, for restoration of individual and community efficacy, and ultimately for hope and dignity

*Department of the Interior and Related Agencies Appropriations for 1991: Emergency preparedness* Test Prep Books

"The capacity to reach every person in a community is one of the major goals for emergency preparedness and response. The goal of emergency health communication is to rapidly get the right information to the entire population so that they are able to make the right choices for their health and safety. To do this, a community must know what subgroups make up its population, where the people in these groups live and work, and how they best receive information. Although knowing this type of information might seem obvious, many jurisdictions have not yet begun the process to define or locate their at-risk populations. To maintain consistency with the Pandemic and All-Hazards Preparedness Act (PAHPA), this workbook uses the term "at-risk populations" to describe individuals or groups whose needs are not fully addressed by traditional service providers or who feel they cannot comfortably or safely use the standard resources offered during preparedness, response, and recovery efforts. These groups include people who are physically or mentally disabled (e.g., blind, deaf, hard-of-hearing, have learning disabilities, mental illness or mobility limitations), people with limited English language skills,

---

geographically or culturally isolated people, homeless people, senior citizens, and children. Regardless of terminology, trust plays a critical role in reaching at-risk populations. Reaching people through trusted channels has shown to be much more effective than through mainstream channels. For some people, trusted information comes more readily from within their communities than from external sources. This document describes a process that will help planners to define, locate, and reach at-risk populations in an emergency. Additional tools are included to provide resources for more inclusive communication planning that will offer time-saving assistance for state, local, tribal, and territorial public health and emergency management planners in their efforts to reach at-risk populations in day-to-day communication and during emergency situations. If you follow the process outlined in this document, you will begin to develop a Community Outreach Information Network (COIN)--a grassroots network of people and trusted leaders who can help with emergency response planning and delivering information to at-risk populations in emergencies. Building a strong network of individuals who are invested in their community's well-being, who are prepared and willing to help, and who have the ability to respond in an emergency is just the start. You must also include network members in your emergency preparedness planning, test the capacity of your COIN to disseminate information through preparedness exercises, and make changes to your preparedness plans based on the evaluation of those exercises."--Page 4.

emergency behavior and disaster myths has not been conducted in the United States for decades. A United States community sample of study participants responded to questionnaires about these issues. Their preparation for natural and man-made catastrophic events, their beliefs in disaster myths, and what behavior they predict they might engage? 383 participants that broadly represented the United States demographically responded to the study's four surveys: a demographics questionnaire (N = 383), an emergency preparedness questionnaire used by FEMA (N = 330), a version of a disaster myths questionnaire created by Dr. John Drury and colleagues from the University of Sussex (N = 280), and a questionnaire about self-predicted behavior created by this researcher including three disaster vignettes (natural disaster, manmade disaster, and terrorist attack) (N = 250). Results indicate about 1/3 of individuals report being sufficiently prepared for an emergency and over 70% positively identify with disaster myths. For self-prediction, more than 90% of respondents predicted preparatory behavior and more than 80% predicted prosocial behavior. Notably, at least 14% of respondents predicted antisocial behavior. Variables such as race/ethnicity, income, and gender were related to antisocial behavior. Religious identification predicted prosocial behavior and decreased disaster myth belief, and a past history of emergency training was correlated with greater general preparedness. These findings suggest a population found in the United States that is mostly unprepared for emergencies, believes in disaster myths, and depending on demographic background may be more or less likely to engage in prosocial or antisocial behavior following a disaster. Future research should examine disaster denial, interactional effects, and belief in disaster myths.
