This cahier unites two texts by celebrated Canadian poet Anne Carson, encouraging readers to experience them alongside and illuminating each other. 'Variations on the Right to Remain Silent' is an essay on the stakes involved when translation happens, ranging from Homer through Joan of Arc to Paul Celan; it includes the author's seven

translations of a poetic fragment from the Greek poet Ibykos. 'By Chance the Cycladic People' is a poem about Cycladic culture where the order of the lines has been determined by a random number generator. The cahier is illustrated by Lanfranco Quadrio.

Cities of Light and Heat takes us to Kansas City and Denver during the late nineteenth century when gas and electricity were introduced to these "instant cities" of the west. With rich detail, Mark Rose shows how the new technology spread during the next century from a few streets and businesses within the city limits to countless private homes in the suburbs. In Kansas City and Denver, as in most communities throughout the

U.S., business executives, city leaders, and engineers acted as early promoters of the new technology. But by the early 1900s educators, home builders, architects, and salespersons were becoming increasingly important as gas and electric utilities and appliances reached more and more American homes. But these voices for the new technology brought with them their own social attitudes and cultural values. By mid-century, whether in the classroom or in advertisements, Americans were regularly encouraged to fit the new technology within prevailing notions of cleanliness, comfort, convenience, and gender. Although in hindsight the spread

of modern technology might seem inevitable to us, Rose shows how even the leaders of the nation's great gas and electric corporations with their vast production and distribution facilities were subject to geography, competing ideologies, urban politics, and even the choices of ordinary consumers. Rose thus locates the driving force behind the diffusion of technology in the neighborhoods, kitchens, and offices of the city. Cities of Light and Heat shows the importance of culture, politics, and urban growth in shaping technological change in the cities of North America. Electronics World DIANE Publishing

Profitability is the key to any production line's existence, and to

maintain profitability, production processes must continually improve. As products change, the production lines must adapt quickly, often drastically. This stressful metamorphosis leads to one inevitable result: drastic inefficiencies. To assure the success of a new production line, one must optimize the production processes as quickly as possible.

But how do you optimize a world with dozens of factors in a matter of a few weeks? The key is methodology, and specifically, a methodology called Design of Experiments (DOE). This "art" is the result of years of research by ingenious statisticians, and its application is finding uses in varied fields such as advertising,

marketing and product design.

This book narrates the story of Luc, an orchid farmer that finds that his orchid greenhouses are continually less profitable. After much contemplation, Luc decides to change his principal crop from the standard orchid to the highly praised 'African Sunset' orchid. Unfortunately, this beautiful flower is a headache to cultivate and requires completely different growing conditions than his previous orchids. After a couple of disastrous attempts to characterize the cultivation of this exotic orchid with what might be considered "conventional" experimental techniques (changing one variable at a time and seeing what happens), Luc decides to get help

---

for his project. Help comes thanks to Stefan, an experienced statistician, who helps Luc over the pitfalls of characterizing a complex multi-variable process. Through their amusing dialogues and experiences, the reader is lead through the practice of the art of Design of Experiments.

An introduction to the engineering principles of embedded systems, with a focus on modeling, design, and analysis of cyber-physical systems. The most visible use of computers and software is

processing information for human consumption. The vast majority of computers in use, however, are much less visible. They run the engine, brakes, seatbelts, airbag, and audio system in your car. They digitally encode your voice and construct a radio signal to send it from your cell phone to a base station. They command robots on a factory floor, power generation in a power plant, processes in a chemical plant, and traffic lights in a city. These less visible computers are called embedded systems, and the software they run is called embedded software. The

---

principal challenges in designing and analyzing embedded systems stem from their interaction with physical processes. This book takes a cyber-physical approach to embedded systems, introducing the engineering concepts underlying embedded systems as a technology and as a subject of study. The focus is on modeling, design, and analysis of cyber-physical systems, which integrate computation, networking, and physical processes. The second edition offers two new chapters, several new exercises, and other improvements. The book can

be used as a textbook at the advanced undergraduate or introductory graduate level and as a professional reference for practicing engineers and computer scientists. Readers should have some familiarity with machine structures, computer programming, basic discrete mathematics and algorithms, and signals and systems.

From her seminal *Eros the Bittersweet* (1986) to her experimental *Float* (2016), *Bakkhai* (2017) and *Norma Jeane Baker of Troy* (2019), Anne Carson's engagement with antiquity has been deeply influential to generations of

---

readers, both inside and outside of academia. One reason for her success is the versatile scope of her classically-oriented oeuvre, which she rethinks across multiple media and categories. Yet an equally significant reason is her profile as a classicist. In this role, Carson unfailingly refuses to conform to the established conventions and situated practices of her discipline, in favour of a mode of reading classical literature that allows for interpretative and creative freedom. From a multi-praxis, cross-disciplinary perspective, the volume explores the erudite

indiscipline of Carson's classicism as it emerges in her poetry, translations, essays, and visual artistry. It argues that her classicism is irreducible to a single vision, and that it is best approached as integral to the protean character of her artistic thought. Anne Carson/*Antiquity* collects twenty essays by poets, translators, artists, practitioners and scholars. It offers the first collective study of the author's classicism, while drawing attention to one of the most avant-garde, multifaceted readings of the classical past. American Book Publishing

MARTHA is a set of general-purpose programs for analyzing linear electrical networks, available to users with access to APL time-sharing systems. The programs analyze, as a function of frequency, most linear "transmission-type" networks, with an input and an output. This includes most filters, amplifiers, microwave networks, and feedback systems, even if such circuits are relatively complicated, with multiple feedback paths and branches. The programs cannot handle some complicated interconnections of components, and are not set up

---

to analyze nonlinear or time varying networks. The topology of the network is described using "wiring operators." The elements available include lumped and distributed, active and passive, reciprocal and nonreciprocal elements. The possible output includes two-port parameters (impedance, admittance, hybrid, scattering, and ABCD matrices), as well as voltage gain, insertion gain, transducer gain, etc. These, their real or imaginary parts, or magnitude or phase, may be printed or plotted as functions of frequency or of each other. More than one network can be

analyzed simultaneously. MARTHA is not inherently better at one frequency range than another, except perhaps in its repertoire of elements and response functions. MARTHA includes, besides R, L, and C, sixteen controlled sources; operational amplifiers; mutual inductance; three transistor models and the possibility of easily creating others; ideal transformers; several composite pi and tee structures; and a few exotic elements such as gyrators. For high-frequency applications MARTHA has several microwave elements, including TEM transmission

lines, waveguides, attenuators, and isolators.
