Cardiac arrest can strike a seemingly healthy individual of any age, race, ethnicity, or gender at any time in any location, often without warning. Cardiac arrest is the third leading cause of death in the United States, following cancer and heart disease. Four out of five cardiac arrests occur in the home, and more than 90 percent of individuals with cardiac arrest die before reaching the hospital. First and foremost, cardiac arrest treatment is a community issue - local resources and personnel must provide appropriate, high-quality care to save the life of a community member. Time between onset of arrest and provision of care is fundamental, and shortening this time is one of the best ways to reduce the risk of death and disability from cardiac arrest. Specific actions can be implemented now to decrease this time, and recent advances in science could lead to new discoveries in the causes of, and treatments for, cardiac arrest. However, specific barriers must first be addressed. Strategies to Improve Cardiac Arrest Survival examines the complete system of response to cardiac arrest in the United States and identifies opportunities within existing and new treatments, strategies, and research that promise to improve the survival and recovery of patients. The recommendations of Strategies to Improve Cardiac Arrest Survival provide high-priority actions to advance the field as a whole. This report will help citizens, government agencies, and private industry to improve health outcomes from sudden cardiac arrest across the United States.

Annual Report to Congress on the Implementation of the Education of the Handicapped Act National Academies Press

This User ' s Guide is intended to support the design, implementation, analysis, interpretation, and quality evaluation of registries created to

increase understanding of patient outcomes. For the purposes of this guide, a patient registry is an organized system that uses observational study methods to collect uniform data (clinical and other) to evaluate specified outcomes for a population defined by a particular disease, condition, or exposure, and that serves one or more predetermined scientific, clinical, or policy purposes. A registry database is a file (or files) derived from the registry. Although registries can serve many purposes, this guide focuses on registries created for one or more of the following purposes: to describe the natural history of disease, to determine clinical effectiveness or cost-effectiveness of health care products and services, to measure or monitor safety and harm, and/or to measure quality of care. Registries are classified according to how their populations are defined. For example, product registries include patients who have been exposed to biopharmaceutical products or medical devices. Health services registries consist of patients who have had a common procedure, clinical encounter, or hospitalization. Disease or condition registries are defined by patients having the same diagnosis, such as cystic fibrosis or heart failure. The User ' s Guide was created by researchers affiliated with AHRQ ' s Effective Health Care Program, particularly those who participated in AHRQ ' s DEcIDE (Developing Evidence to Inform Decisions About Effectiveness) program. Chapters were subject to multiple internal and external independent reviews.

Practitioner's Guide to Dynamic Assessment CRC Press  
Dynamic assessment is a recently developed, interactive approach to psychoeducational assessment that follows a test-intervene-retest format, focuses on learning processes and modifiability, and provides the possibility of direct linkage between assessment and intervention. The second book on the topic by Dr. Lidz, this volume is a hands-on guide that is designed specifically for practitioners who engage in diagnostic assessment related to the functioning of children in school. It reviews and critiques current models of dynamic assessment and presents the research available on these existing models. But primarily, this is a text to help practitioners carry out an actual dynamic assessment procedure. The book includes two comprehensive manuals, each providing theoretical background, descriptions of procedures, forms, and reviews of available research. The first manual describes the Mediated Learning Experience Rating Scale. This scale adapts Feuerstein's concept of MLE, postulated to describe adult activities within an adult-child interaction that facilitate the child's cognitive development. The scale is useful for assessment and consultation with both parents and teachers and, in addition, it also describes the behavior of the assessor during the course of dynamic assessment. The second manual describes the author's model for dynamic assessment. This model rests on a theory of neuropsychological foundations of mental processing as developed by Luria and elaborated by Naglieri and Das. The model preserves the test-intervene-retest format, focuses on learner modifiability and, most significantly, links the assessment with educational interventions. Detailing the implementation of an actual dynamic assessment procedure that is linked with educational interventions, this book is a valuable guide for diagnostic assessors from a wide variety of backgrounds including school, clinical, and counseling psychology, as well as special and regular education and speech and language pathology.

PRACTITIONER'S GUIDE TO DYNAMIC ASSESSMENT also serves as a text for advanced graduate courses in assessment.

This important volume provide a one-stop resource on the SAFER Guides along with the guides themselves and information on their use, development, and evaluation.

The Safety Assurance Factors for EHR Resilience (SAFER) guides, developed by the editors of this book, identify recommended practices to optimize the safety and safe use of electronic health records (EHRs). These guides are designed to help organizations self-assess the safety and effectiveness of their EHR implementations, identify specific areas of vulnerability, and change their cultures and practices to mitigate risks. This book provides EHR designers, developers, implementers, users, and policymakers with the requisite historical context, clinical informatics knowledge, and real-world, practical guidance to enable them to utilize the SAFER Guides to proactively assess the safety and effectiveness of their electronic health records EHR implementations.

The first five chapters are designed to provide readers with the conceptual knowledge required to understand why and how the guides were developed. The next nine chapters focus on the underlying informatics concepts, key research activities, and methods used to develop each of the guides. Each of these chapters concludes with a copy of the guide itself. The final chapter provides a vision for the future and the work required to ensure that future generations of EHRs are designed, developed, implemented, and used to improve the overall safety of the EHR-enabled healthcare system. Taken together, the information provided in this book should help any organization, whether large or small, implement its EHR program and improve the safety and effectiveness of its existing EHR-enabled healthcare systems. This volume will be extremely valuable to small, ambulatory physician practices and larger outpatient settings as well as for hospitals and professors and instructors charged with teaching safe and effective implementation and use of EHRs. It will also be highly useful for health information technology professionals responsible for maintaining a safe and effective EHR and for clinical and administrative staff working in EHR-enabled healthcare systems.

Systems, Social, and Internationalization Design Aspects of Human-computer Interaction AAPC

When hospitals began implementing their electronic medical records/electronic health records systems (EMR/HER) the pharmaceutical companies that were conducting clinical trials at those hospitals wanted to sue the date from those systems instead of having the hospitals enter the data in their EHR systems and also in the study data entry system. However, the FDA regulations would require that the hospital systems be "validated". The hospitals and the companies developing the systems argued that was "over-regulation." HIMSS published their Developer Code of Conduct where they said instead they would use Quality Management techniques. This book covers how to use Quality Management (ISO 9001) to develop computer systems, specifically EMR systems. It gives a basic introduction to how to implement computer systems. It also covers the topic of compliance because the hospitals are required to comply with regulations other than FDS regulations. The book also discusses the topics of risk management and conducting audits, both of which are part of

ISO 9001 quality management of computer systems. The book is designed to give the reader an introduction to the things you have to do when implementing a computer system that has to satisfy some standards and where the accuracy of the information could impact the accuracy of a person ' s medical treatment.
