o history of endocrinology can be  
written without reference N to Sir  
Humphry Davy Rolleston, whose  
monumental study of the subject  
appeared in 1936 under the  
modest subtitle: The Endocrine  
Organs in Health and Disease  
with an Historical Review. It was  
based on the author's Fitzpatrick  
Lectures at the Royal College of  
Physicians of London in 1933 and  
1934. The lectureship, which  
dates from 1901, is devoted to the  
History of Medicine. Rolleston's  
work as regards scholarship and  
delivery cannot be surpassed and  
will remain the solid basis for any  
further study. It is of interest to  
note that Rolleston gave the  
Fitzpatrick Lectures when he was  
71 years of age and had his book  
published when he was 74. By  
that time he had achieved most of  
his professional aims and all the  
honours a distinguished medical  
career can offer (see Section II).  
He perceived clearly that  
endocrinology was "an enormous  
subject in a most active stage of  
growth", which "recently has  
received most valuable help from  
organic chemists, who have  
devoted much time to the  
elucidation of the structure,

isolation and synthesis of the  
hormones". He remarked that the  
knowledge of endocrinology was  
expanding with extreme rapidity,  
and it has been suggested that in  
this respect it would appear to be  
itself influenced by a growth  
hormone. He continued: "Before  
1890 there were comparatively  
few publications dealing with the  
ductless glands, but in 1913, A.

The brain ... There is no  
other part of the human  
anatomy that is so intriguing.  
How does it develop and  
function and why does it  
sometimes, tragically,  
degenerate? The answers are  
complex. In *Discovering the  
Brain*, science writer Sandra  
Ackerman cuts through the  
complexity to bring this vital  
topic to the public. The  
1990s were declared the  
"Decade of the Brain" by

responded with a host of new

public and private sectors can contribute to continued advances in neuroscience. This highly readable volume will provide the public and policymakers and many scientists as well with a helpful guide to understanding the many discoveries that are sure to be announced throughout the "Decade of the Brain." Handbook of Clinical Obstetrics John Wiley & Sons The aim of this treatise is to summarize the current understanding of the mechanisms for blood flow control to skeletal muscle under resting conditions, how perfusion is elevated (exercise hyperemia) to meet the increased demand for oxygen and other substrates during exercise, mechanisms underlying the beneficial effects of regular physical activity on cardiovascular health, the regulation of transcapillary fluid filtration and protein flux across the microvascular exchange vessels, and the role of changes in the skeletal muscle circulation in pathologic states. Skeletal muscle is unique among organs in that its blood flow can change over a remarkably large range. Compared to blood flow at rest, muscle blood flow can increase by more than 20-fold on average during intense exercise, while perfusion of certain individual

white muscles or portions of those muscles can increase by as much as 80-fold. This is compared to maximal increases of 4- to 6-fold in the coronary circulation during exercise. These increases in muscle perfusion are required to meet the enormous demands for oxygen and nutrients by the active muscles. Because of its large mass and the fact that skeletal muscles receive 25% of the cardiac output at rest, sympathetically mediated vasoconstriction in vessels supplying this tissue allows central hemodynamic variables (e.g., blood pressure) to be spared during stresses such as hypovolemic shock. Sympathetic vasoconstriction in skeletal muscle in such pathologic conditions also effectively shunts blood flow away from muscles to tissues that are more sensitive to reductions in their blood supply that might otherwise occur. Again, because of its large mass and percentage of cardiac output directed to skeletal muscle, alterations in blood vessel structure and function with chronic disease (e.g., hypertension) contribute significantly to the pathology of such disorders. Alterations in skeletal muscle vascular resistance and/or in the exchange properties of this vascular bed also modify transcapillary fluid filtration and solute movement across the microvascular barrier to

influence muscle function and contribute to disease pathology. Finally, it is clear that exercise training induces an adaptive transformation to a protected phenotype in the vasculature supplying skeletal muscle and other tissues to promote overall cardiovascular health. These guidelines have been approved by the four organizations that make up the Cooperating Parties for the ICD-10-CM: the American Hospital Association (AHA), the American Health Information Management Association (AHIMA), CMS, and NCHS.

These guidelines are a set of rules that have been developed to accompany and complement the official conventions and instructions provided within the ICD-10-CM itself. The instructions and conventions of the classification take precedence over guidelines. These guidelines are based on the coding and sequencing instructions in the Tabular List and Alphabetic Index of ICD-10-CM, but provide additional instruction. Adherence to these guidelines when assigning ICD-10-CM diagnosis codes is required under the Health Insurance Portability and Accountability Act (HIPAA). The diagnosis codes (Tabular List and Alphabetic Index) have been adopted under HIPAA for all healthcare settings. A joint effort between the healthcare provider and the coder is essential to achieve complete and accurate documentation, code assignment, and reporting of diagnoses and procedures. These guidelines have been developed to assist both the healthcare provider and the coder in identifying those diagnoses that are to be reported. The importance of consistent, complete documentation in the medical record cannot be overemphasized. Without such documentation accurate coding cannot be achieved. The entire record should be reviewed to determine the specific reason for the encounter and the conditions treated.
