### *The engine | How a Car Works*

Combustion, also known as burning, is the basic chemical process of releasing energy from a fuel and air mixture. In an internal combustion engine (ICE), the ignition and combustion of the fuel occurs within the engine itself. The engine then partially converts the energy from the combustion to work.

The type of fuel burned by either power plant doesn't change anything in relation to the engine's general makeup (i.e. a crankshaft spinning, connecting rods and pistons moving up and down, air being pumped in, and exhaust being routed out). In fact, the same basic architecture is very much the same.

#### How Do Diesel Engines Work? - dummies

The subsequent combustion rapidly expands and pushes

the piston down the length of the cylinder bore, away from the cylinder head, and with a lot of pressure. That power produced in one cylinder is multiplied because the combustion events are repeated in each of the cylinders. This is the basic premise on how an engine works.

#### **Aircraft engine - Wikipedia**

The basic difference between a diesel engine and a gasoline engine is that in a diesel engine, the fuel is sprayed into the combustion chambers through fuel injector nozzles just when the air in each chamber has been placed under such great pressure that it's hot enough to ignite the fuel spontaneously.
