Displacement is used to calculate the compression ratio of an engine and is used to indicate the size of an engine. The formula to find engine displacement is: displacement = $\pi \times b^2 \times s \times c$. Where b is equal to the bore size, s is equal to the stroke length, and c is the number of cylinders.

Mortec Chevy V-8 Engine Bore and Stroke Specifications

Bore = [displacement ÷ (0.7854 x stroke x number of cylinders)] In the case of a 305 Chevy, the stroke is 3.48 inches, the same as a 350. By plugging in the known variables, you calculate the unknown bore dimension as follows. Bore = [305 ÷ (0.7854 x 3.48 x 8)] = 3.734 inches bore diameter Calculator sequence:

Engine Bore - Kohler, Briggs & Stratton, Onan,

The term "bore" refers to the diameter of a cylinder in a piston engine. If you're assembling or rebuilding an engine, knowing the bore of each cylinder will allow you to install pistons of an appropriate size to ensure adequate clearance during firing and prevent excess wear or other, more dangerous issues.
