As a result of deregulation, the US electric utility industry is undergoing a dramatic transformation with far-reaching technical and social consequences. At the heart of this transformation lies Distributed Generation (DG)-the substitution of centralized electricity production with smaller-scale technologies located in or near facilities and powered by natural gas or renewable resources. The Electric Power Research Institute estimates that 20

percent of all new power generation will use distributed, not centralized technologies. Distributed Generation: The Power Paradigm for the New Millennium is the first step to understanding the myriad issues that surround the newest, most significant trend in power production since the steam turbine. Chapters contributed by the top experts in their fields address virtually every aspect of this energy "revolution," from its associated technologies to the regulatory environment and from choosing the right DG system for a given purpose to the novel financial and economic opportunities this paradigm shift presents. This book gives engineers and energy business developers their first opportunity to explore and gain a broad understanding of the new energy landscape.

With its detailed discussion of the near-term technologies that will see application in the next few years, Distributed Generation: The Power Paradigm for the New Millennium will undoubtedly become the industry's standard reference.

Microsystems are an important success factor in the automobile industry. In order to fulfil the customers requests for safety convenience and vehicle economy, and to satisfy environmental

requirements, microsystems are becoming indispensable. Thus a large number of microsystem applications came into the discussion. With the international conference AMAA 2002, VDI/VDE-IT provides a platform for the discussion of all MST relevant components for automotive applications. The conference proceedings gather the papers by authors from automobile suppliers and manufacturers.
