A critical element in maintaining engine safety and in providing post-production service and support of a commercial aircraft engine is the complete worldwide network of maintenance, repair, and overhaul facilities. Matching forecasted shop visit demand to network-wide capacity is essential to ensuring the required resources are in place to quickly repair and return these assets to the airline customer. A capacity analysis

methodology is developed to characterize and analyze the current network capacity for the PW1100G Geared Turbofan engine model for Gate 3 Engine Testing processes. This capacity model is then compared to the anticipated monthly shop visit demand for engine repair services through 2026. By identifying capacity shortages earlier in the program, Pratt & Whitney can proactively plan for and fund additional resources to improve capacity, ensuring the required capacity is in place when demand materializes to reduce shop visit delays. The results of the PW1100G capacity study are

utilized both to provide recommendations for the anticipated timeframe when additional resources will be required to meet projected demand and to outline major planning milestones required to meet the resource need date.
