Storage engines are MySQL components that handle the SQL operations for different table types. InnoDB is the default and most general-purpose storage engine,

and Oracle recommends using it for tables except for specialized use cases. (The CREATE TABLE statement in MySQL 5.7 creates InnoDB tables by default.)

15.1 Setting the Storage Engine - MySQL

For new tables, MySQL always creates an .frm file to hold the table and column definitions. The table's index and data may be stored in one or more other files, depending on the storage engine. The server creates the .frm file above the storage engine level. Individual storage engines create any additional files required for the tables that they manage.

The storage engine for TEMPORARY tables created with CREATE TEMPORARY TABLE can be set separately from the engine for permanent tables by setting the default_tmp_storage_engine, either at startup or at runtime. To convert a table from one storage engine to another, use an ALTER TABLE statement that indicates the new engine:
