Launched in 1991, the New Engineering Contract (NEC) has become one of the UK's leading standard forms of contract for major construction and civil engineering projects. Currently in the third edition, popularly known as NEC 3, it is a process based construction contract embodying project management best practice, and thus the basic philosophy behind the contract is different to the more adversarial principles and approach of other standard construction contracts. Contracts for Infrastructure Projects: An International Guide provides a guide to the law relating to construction contracts for infrastructure projects; it is intended for the use of engineers and other professionals who are involved in the negotiation and administration of construction contracts, to enable them to understand the risks involved, and how to minimise them. The principles of construction law outlined in this book apply to small construction contracts as well as very large contracts for which the contract sum may be in the billions of dollars. The

focus of the book is on construction contracts entered into by commercial organisations operating in a business environment. Contract law generally assumes that such parties are of equal bargaining power and puts relatively few fetters on their ability to agree on the terms of their bargain. However, where legislation impacts on the execution of construction projects or the operation of construction contracts it may be of major importance in protecting the rights of weaker parties or third parties. It is assumed that the users of this book will be familiar with the general concepts of tendering and contracting for engineering and construction projects but may not have any formal knowledge of the law. To the extent possible, the emphasis is on general principles of contract law that are widely accepted in many jurisdictions. Examples are drawn from case law in a number of common law jurisdictions, as well as from civil codes.

Launched in 1993, the NEC Engineering and Construction Contract has become one of the UK's leading standard forms of contract for major construction and civil engineering projects. The third edition, popularly known as NEC3, is a process based contract embodying project and commercial management best practice, so its basic philosophy differs from the more adversarial approach of other standard construction contracts. Since the first edition of this book, the third edition of the contract has seen the introduction of a new secondary option for use in the UK and amendments to a number of clauses. In addition, in September 2011, changes were introduced to cater for the amendments to the Housing Grants, Construction and Regeneration Act 1996 contained in the Local Democracy, Economic Development and Construction Act 2009, which became effective for all new contracts entered into from 1 October 2011. These amendments have been incorporated into the text. A Practical Guide to the NEC3 Engineering and Construction Contract will be useful to everyone in the construction industry working on a project under this contract. It will be of interest to the complete construction supply chain, including employers, construction professions, contractors and sub-contractors, as well as consultants and lawyers advising any of these parties, either in the preparation of contract documentation or the day to day management or the resolution of problem situations which may arise.

Understanding the NEC4 ECC Contract Thomas Telford

1. HISTORICAL BACKGROUND In the late 1950s many members of the design professions-Engineers as well as Architects-became concerned about their exposure to claims for professional malpractice and particularly about the increasing number of claims that had been successfully brought against them arising out of their Construction Phase activities. This led to special studies sponsored by the American Institute of Architects and the Engineers joint Counsel. The outcome was twofold: the development of a policy of professional liability insurance to insure Engineers and Architects against errors and omissions in the performance of their professional services, and the review and development of the customary contractual arrangements defining the design professional's undertakings vis a vis his client (the Owner), the Project to be designed, and the Contractor who was to implement that design. At the outset, the AIA's Owner-Architect Agreement (No. B131), General Conditions (No. A201) and the Owner-Contractor Agreements (Nos. A101 & 111) were the documents most frequently used by design professionals, and these received particular attention. In the early 1960s it became apparent that there was a need for a separate series of documents prepared to address these relationships when the Project to be designed involved primarily engineering considerations. The number of Projects for which the Engineer was employed by the Owner as the prime professional to handle the Project design and construction administration was increasing.
