With the rise of shared and networked vehicles, autonomous vehicles, and other transportation technologies, technological change is outpacing urban planning and policy. Whether urban planners and policy makers like it or not, these transformations will in turn result in profound changes to streets, land use, and cities. But smarter transportation may not necessarily translate into greater sustainability or equity. There are clear opportunities to shape advances in transportation, and to harness them to reshape cities and improve the socio-economic health of cities and residents. There are opportunities to reduce collisions and improve access to healthcare for those who need it most—particularly high-cost, high-need individuals at the younger and older ends of the age spectrum. There is also potential to connect individuals to jobs and change the way cities organize space and optimize trips. To date, very little discussion has centered around the job and social implications of this technology. Further, policy dialogue on future transport has lagged—particularly in the arenas of sustainability and social justice. Little work has been done on decision-making in this high uncertainty environment—a deficiency that is concerning given that land use and transportation actions have long and lagging timelines. This is one of the first books to explore the impact that emerging transport technology is having on cities and their residents, and how policy is needed to shape the cities that we want to have in the future. The book contains a selection of contributions based on the most advanced empirical research, and case studies for how future transport can be harnessed to improve urban sustainability and justice.

Drawing on a variety of theoretical concepts and methods, this book addresses the interface between language, politics and translation. The contributors analyse the role, practice and impact of journalistic translation in Canada, China, Arab countries, France, Spain, the Ukraine, Finland and Serbia. The introductory chapter surveys the evolution of journalistic translation research during the period 2015-2020. The chapters that follow delve into the role of language and translation in news production with a specific focus on the connections with politics and power. The authors analyse Canadian newspapers in French and English during the subprime crises, the representation of Muslims in three European newspapers in the aftermath of Nice terrorist attacks, the translation of Donald Trump's tweets in Spain, the role of evaluation in opinion articles in the Ukraine, the use of reported speech in Finnish articles, the translation of Donald Trump's offensive comments into Arabic and so on. In the discussions, the authors draw on functional grammar, critical discourse analysis, Appraisal theory and pragmatics. This volume will appeal to all those interested in the ways translation shapes media constructions of news events and showcases the centrality of journalistic translation research as a dynamic subfield within translation studies. The chapters in this book were originally published as a special issue of the journal Perspectives: Studies in Translation Theory and Practice.

The essential introduction to the principles and applications of feedback systems—now fully revised and expanded This textbook covers the mathematics needed to model, analyze, and design feedback systems. Now more user-friendly than ever, this revised and expanded edition of Feedback Systems is a one-volume resource for students and researchers in mathematics and engineering. It has applications across a range of disciplines that utilize feedback in physical, biological, information, and economic systems. Karl Åström and Richard Murray use techniques from physics, computer science, and operations research to introduce control-oriented modeling. They begin with state space tools for analysis and design, including stability of solutions, Lyapunov functions, reachability, state feedback observability, and estimators. The matrix exponential plays a central role in the analysis of linear control systems, allowing a concise development of many of the key concepts for this class of models. Åström and Murray then develop and explain tools in the frequency domain, including transfer functions, Nyquist analysis, PID control, frequency domain design, and robustness. Features a new chapter on design principles and tools, illustrating the types of problems that can be solved using feedback Includes a new chapter on fundamental limits and new material on the Routh-Hurwitz criterion and root locus plots Provides exercises at the end of every chapter Comes with an electronic solutions manual An ideal textbook for undergraduate and graduate students Indispensable for researchers seeking a self-contained resource on control theory

Most social scientific work on intimate relationships has assumed a monogamous structure, or has considered anything other than monogamy only in the context of 'infidelity'. Yet, in recent years there has been a growing interest among researchers and the public in exploring various patterns of intimacy that involve open non-monogamy. This volume gathers contributions from academics, activists, and practitioners throughout the world to explore non-monogamous relationships. Featuring both empirical and theoretical pieces, contributors examine the history and cultural basis of various forms of non-monogamy, experiences of non-monogamous living, psychological understandings of relationship patterns, language and emotion, the discursive construction of mono-normativity as well as issues of race, class, disability, sexuality and gender. This volume will be of interest to academics and practitioners working in the social sciences and anyone who is seeking greater insight into the intricacies of non-monogamous relationships.

The 1980s have witnessed a tremendous growth in the field of computer integrated manufacturing systems. The other major areas of development have been computer-aided design, computer-aided manufacturing, industrial robotics, automated assembly, cellular and modular material handling, computer networking and office automation to name just a few. These new technologies are generally

capital intensive and do not conform to traditional cost structures. The net result is a tremendous change in the way costs should be estimated and economic analyses performed. The majority of existing engineering economy texts still profess application of traditional analysis methods. But, as was mentioned above, it is clear that the basic trend in manufacturing industries is itself changing. So it is quite obvious that the practice of traditional economic analysis methods should change too. This book is an attempt to address the various issues associated with non-traditional methods for evaluation of advanced computer-integrated technologies. This volume consists of twenty refereed articles which are grouped into five parts. Part one, Economic Justification Methods, consists of six articles. In the first paper, Soni et al. present a new classification for economic justification methods for advanced automated manufacturing systems. In the second, Henghold and LeClair look at strengths and weaknesses of expert systems in general and more specifically, an application aimed at investment justification in advanced technology. The third paper, by Carrasco and Lee, proposes an enhanced economic methodology to improve the needs analysis, conceptual design and detailed design activities associated with technology modernization.

Histories of Egyptology are increasingly of interest: to Egyptologists, archaeologists, historians, and others. Yet, particularly as Egypt undergoes a contested process of political redefinition, how do we write these histories, and what (or who) are they for? This volume addresses a variety of important themes, the historical involvement of Egyptology with the political sphere, the manner in which the discipline stakes out its professional territory, the ways in which practitioners represent Egyptological knowledge, and the relationship of this knowledge to the public sphere. Histories of Egyptology provides the basis to understand how Egyptologists constructed their discipline. Yet the volume also demonstrates how they construct ancient Egypt, and how that construction interacts with much wider concerns: of society, and of the making of the modern world.

In the first decade of the twenty-first century, globalization and identity have emerged as the most critical challenges to world peace. This volume of Peace & Policy addresses the overarching question, "What are the effects of globalization in the areas of culture, ethnic diversity, religion, and citizenship, and how does terrorism help groups attain a sense of global identity?" Part I, "Citizenship in a Globalizing World," reexamines globalization in light of the traditions from which human civilizations have evolved. Linda Groff focuses on Samuel R. Huntington's thesis that the Cold War would be followed by a clash of civilizations. Joseph A. Camilleri traces the history of the concept of citizenship and its transformation through the ages to modern times. Kamran Mofid argues that the marketplace is not just an economic sphere but one where economic and business interests must embrace the spiritual assets of the community. Majid Tehranian raises the problem of identity and advocates the assumption of global identity, responsibility, and citizenship. Part II, "Convergence in Global Cultures," explores the complex issues of diversity in religions. Christopher Leeds, Vladimir Korobov, and Bharat Gupta show how the reconceptualization of the world both geographically and regionally can recreate new sensibilities needed to overcome differences. Part III, "Divergence in Global Conflicts," discusses the multiple dimensions of the globalizing effects of economic expansion and political strife experienced by different cultures at local and regional levels. Audrey Kitigawa and Ade Ogundiran use Nigeria as an example of political manipulation of religious and ethnic groups to divert attention from the real problems of social and economic marginalization. Fred Riggs looks at how the Web has become a medium in the globalization of religious movements. The authors maintain that continuing efforts for dialogue across cultural and religious boundaries in today's

Basic Principles and Calculations in Chemical Engineering Princeton University Press

In Europe after World War II, U.S. economic aid helped to ensure economic revival, political stability, and democracy. In the Third World, however, aid has been associated with very different tendencies: uneven political development, violence, political instability, and authoritarian rule in most countries. Despite these differing patterns of political change in Europe and the Third World, however, American conceptions of political development have remained largely constant: democracy, stability, anti-communism. Why did the objectives and theories of U.S. aid officials and social scientists remain largely the same in the face of such negative results and despite the seeming inappropriateness of their ideas in the Third World context? Robert Packenham believes that the thinking of both officials and social scientists was profoundly influenced by the "Liberal Tradition" and its view of the American historical experience. Thus, he finds that U.S. opposition to revolution in the Third World stems not only from perceptions of security needs but also from the very conceptions of development that are held by Americans. American pessimism about the consequences of revolution is intimately related to American optimism about the political effects of economic growth. In his final chapter the author offers some suggestions for a future policy. Originally published in 1973.
