Civil PE Practice Exam: California Civil Engineering Surveying Version A

Walter de Gruyter

"Indeed, the most important part of engineering work—and also of other scientific work—is the determination of the method of attacking the problem, whatever it may be, whether an experimental investigation, or a theoretical calculation. ... It is by the choice of a suitable method of attack, that intricate problems are reduced to simple phenomena, and then easily solved." Charles Proteus Steinmetz. The structure of this book is to provide a sequence of theory, workshops and practical field sessions that mimic a simple survey project, designed for civil and mining engineers. The format of the book is based on a number of years of experience gained in presenting the course at undergraduate and post graduate levels. The course is designed to guide engineers through survey tasks that the engineering industry feels is necessary for them to have a demonstrated competency in surveying techniques, data gathering and reduction, and report presentation. The course is not designed to make engineers become surveyors. It is designed to allow an appreciation of the civil and mine engineering surveyor's job. There are many excellent text books available on the subject of engineering surveying, but they address the surveyor, not the engineer. Hopefully this book will distil many parts of the standard text book. A lot of the material presented is scattered through very disparate sources and has been gathered into this book to show what techniques lie behind a surveyor's repertoire of observational and computational skills, and provide an understanding of the decisions made in terms of the presentation of results. The course has been designed to run over about 6 weeks of a semester, providing a half unit load which complements a computer aided design (CAD) based design project.

The primary aim of this book is to provide a guide to current practice and equipment for non-specialist surveyors in the various professions involved in the construction industry and the environment. It is suitable for students preparing for degrees and diplomas in architecture, building, building surveying, quantity surveying, estate management and town planning and environmental studies. It is also of value to engineers who are not specialising in engineering surveying. This book has been thoroughly revised to include new topics such as OS digital mapping, standard deviation and standard error, global positioning systems, transition and vertical curves. Walter Whyte was born in New Zealand of Scottish parents and educated in Scotland. He worked on site and building surveys in Scotland. He worked on site and building surveys in Scotland, then on road survey and setting out in the North Nyanza and Uasin Gishu Provinces of Kenya, and as a road engineer in British Southern Cameroons and Northern Nigeria, De Montford University in the UK and latterly at City University, Hong Kong. Raymond E Paul has been professionally involved in surveying for over 40 years as a land and cartographical surveyor, senior lecturer and author. He has a wealth of practical experience and an awareness of the needs of the intended users of this book from all corners of the globe.
