Manufacturing and workshop practices have become important in the industrial environment to produce products for the service of mankind. The basic need is to provide theoretical and practical knowledge of manufacturing processes and workshop technology to all the engineering students. This book covers most of the syllabus of manufacturing processes/technology, workshop technology and workshop practices for engineering (diploma and degree) classes prescribed by different universities and state technical boards.

The machinery about which I am writing is found in the confectionery industry, but it is also generally used throughout the food industry and some other areas that produce items that need to be wrapped and packed for distribution. It just happens that much of my working life was spent in the confectionery industry. Similar machinery operates in the pharmaceutical industry, is used for wrapping and handling books, for wrapping blocks of fuel and for packing tea and other items. Some of the robots described are used in the glass industry, loading drinking glasses direct from hot moulding plants. They are used to load filled bottles into cases in the drinks business or shampoo for chemical manufacturers. Other industries, for example the textile industry, used machinery designed for other purposes (such as weaving), before the development of packaging machines, that worked on comparable principles. Some of the mechanisms in all of this machinery possibly have their ancestry in the great cathedral clock mechanisms from as early as the fifteenth century. Just because this book is mainly illustrated by reference to chocolate bars and sweets does not mean that that is the only application, nor does it lessen the ingenuity applied in the designs of these machines or their importance in the modern world.

This e-book and the accompanying handbook attack many of the most crucial difficulties encountered by both native and non-native English speakers when translating scientific and engineering material from German. The e-book is like a miniature encyclopaedia dealing with the fundamental conceptual basis of science, engineering and mathematics, with particular regard to terminology. It provides didactically organised dictionaries, thesauri and a wide range of microglossaries highlighting polysemy, homonymy, hyponymy, context, collocation, usage as well as grammatical, lexical and semantic considerations essential to accurate translation. It also supplies a wide variety of reference material and illustrations useful to self-taught professional technical translators, translator trainers at universities, and especially to student translators. All the main branches of industrial technology are examined, such as mechanical, electrical, electronic, chemical, nuclear engineering, and fundamental terminologies are provided for a broad range of important subfields: automotive engineering, plastics, computer systems, construction technology, aircraft, machine tools. The handbook provides a useful introduction to the

e-book, enabling readers proficient in two languages to acquire the basic skills necessary for technical translation by familiarity with fundamental engineering conceptions themselves. This book is extensively dealing with Technology and Applied Sciences. It covers the first technologies; irrigation systems, road networks and wheeled vehicles, a pictographic form of writing and building techniques. It carries on with the 19th century sciences and new technologies, such as the telegraph, the telephone, electricity generation and photography. It continues into the 20th century with advances in the natural sciences, including radio and television, sound recording and reproduction, synthetic fibres, pharmaceutical products, nuclear power, and the development of the computer and information technology, as a new technological revolution. It also covers; pollution, depletion of energy resources, renewable energy sources such as solar and wind power, the recycling of raw materials, conservation of energy, and about people who in recent years sought to develop appropriate technologies, using local materials and techniques, in partnership with the indigenous peoples.
