[Elements of Water Resources Engineering](#) Elsevier Water is the most essential commodity for human consumption and one of the most important

renewable resources, which must be prevented from deterioration in quality and quantity both. With rapid growing population and improved living standards, the pressure on water resources is increasing. Exploitation of water from the resources for domestic, industrial and agricultural purposes puts resources. Pollution of surface and subsurface water resources poses a serious threat to human health and environment. The surface water sources are largely influenced by anthropogenic activities. As most surface water sources are already polluted by rapid urbanization and industrialization, its adverse effects on shallow subsurface groundwater aquifers are a cause of concern as large population is depending on it. The chemical composition of groundwater is related to the soluble products of rock weathering and decomposition and changes with respect to

time and space. Some elements are essential in trace amounts for human consumption while higher concentrations of the same can cause toxic effects. Water quality depends on local geology, distance from sea, industrial zone, agricultural area and urbanization.

Understanding the molecular underpinnings of life is a task requiring insight from multiple disciplines. In that likeness, biologists have moved toward a systemic approach drawing from the expertise of computational scientists, chemists, engineers, and mathematicians. This collaborative approach requires translation of biological semantics into common language so that the molecular mechanisms can be decoded to promote health, design devices, and preserve environmental homeostasis. This book provides context for biological forms and functions by starting at the molecular level then building outward to include trends in biomedical technology, evolutionary impact, and the

lasting implications for our biosphere. In that likeness, biological concepts underlie most wastewater treatment and provide foundation for the hazardous waste treatment being done today. Furthermore, the relationship between biology and geology is starting to emerge as a key relationship for self-healing concrete and reinforcement protection within concrete.
