Fundamentals of Cancer Epidemiology Springer Science & Business Media
Population studies and epidemiology facilitate the discovery of genetic and environmental determinants of cancer and the development of new approaches to cancer control and prevention, therefore they play a central role in the creation of health policies. Cancer Epidemiology compiles areas of research which cover

etiological factors or determinants that contribute to the development of cancer and describe the latest technologies in cancer epidemiology. In Volume 1, Host Susceptibility Factors, leading experts provide chapters on cancer incidence, prevalence, mortality and surveillance, methods, technologies and study design in cancer epidemiology as well as host susceptibility factors in cancer epidemiology. Although a non-standard volume of the highly successful Methods in Molecular Biology™ series, this comprehensive text retains the commitment of the series to collecting the kind of detailed, up-to-date information and implementation advice that is crucial for getting optimal results.

Cutting-edge and essential, Cancer Epidemiology allows readers to get the maximum advantage of the methods involved in this exciting and important field. Pathology and Epidemiology of Cancer Jones & Bartlett Publishers

In the late 1980s, the National Cancer Institute initiated an investigation of cancer risks in populations near 52 commercial nuclear power plants and 10 Department of Energy nuclear facilities (including research and nuclear weapons production facilities and one reprocessing plant) in the United States. The results of the NCI investigation were used a primary resource for communicating with the public about the cancer risks near the nuclear facilities. However, this study is now over 20 years old. The U.S. Nuclear Regulatory Commission requested that the National Academy of Sciences provide an updated assessment of cancer risks in populations near USNRC-licensed nuclear facilities that utilize or process

uranium for the production of electricity. Analysis of Cancer Risks in Populations near Nuclear Facilities: Phase 1 focuses on identifying scientifically sound approaches for carrying out an assessment of cancer risks associated with living near a nuclear facility, judgments about the strengths and weaknesses of various statistical power, ability to assess potential confounding factors, possible biases, and required effort. The results from this Phase 1 study will be used to inform the design of cancer risk assessment, which will be carried out in Phase 2. This report is beneficial for the general public, communities near nuclear facilities, stakeholders, healthcare providers, policy makers, state and local officials, community leaders, and the media. *Cancer Control Opportunities in Low- and Middle-Income Countries* Humana Press

During the last two decades, molecular epidemiology has become an important discipline in cancer research. It has evolved towards the development, validation and application of markers of susceptibility and, more recently, markers of mechanisms of cancer development. This volume on mechanisms of carcinogenesis covers from an interdisciplinary perspective, the contribution of molecular epidemiology to the understanding of mechanisms of carcinogenesis, and represents a further contribution to the development of molecular

epidemiology as a major cancer research domain.

A Quick Guide to Cancer

Epidemiology is an ideal addition to Springer Briefs in Cancer Research. The Brief provides core concepts in cancer epidemiology and also gives a snapshot of the epidemiology of seventeen human cancers. The Brief aims to provide with quantitative focus-estimates of the global burden of neoplasms, of recent and likely future trends, distribution, causes and strategies for prevention for major groups of cancers. Finally, the Brief will give an overview of several factors that cause cancer including dietary factors, tobacco smoking, obesity and alcohol consumption. The Causes of Cancer Cambridge University Press

Cancer Precursors is a groundbreaking, multidisciplinary text containing a comprehensive overview of methodological issues associated with the study of pre-cancerous conditions, as well as reviews of the contributions of descriptive, analytical, and molecular epidemiological research to knowledge about cancer precursors at specific anatomical locations. The research focuses on the early natural history of cancers, by helping to define the etiology of precursor lesions, improving the means of detecting them either directly or via testing of surrogate biomarkers, and by elucidating the role of remote causes leading to the early onset of such lesions.

This book integrates the disciplines of cancer pathology and epidemiology to provide a synergistic and complementary approach to understanding the molecular mechanisms of cancer.

This book provides relevant information on the diagnostic, prognostic and predictive molecular pathology of cancer. Epidemiological studies, including descriptive epidemiology, risk factors and molecular mechanisms of disease inform on the etiology and progression of cancer. The text concentrates on major cancers that are currently prevalent and those for which substantial molecular, pathological and epidemiological data is available. Each section is designed to provide an overview of that cancer type in terms of basic biology, review the current epidemiological data surrounding that cancer type and provide information on common practices and challenges related to the molecular pathology of that cancer type. Several relevant techniques in molecular pathology, which facilitate diagnosis and treatment are also explored. Pathology and Epidemiology of Cancer provides a succinct and comprehensive overview of multiple cancer types to guide clinicians during patient care and to guide scientists for innovations in research. It represents an integral resource for pathologists, epidemiologists, medical students as well as translational, basic and clinical science researchers who are all working to progress the field of cancer in terms of diagnosis, treatment and prevention.

This atlas illustrates the latest available data on the cancer epidemic, showing causes, stages of development, and prevalence rates of different types of cancers by gender, income group, and region. It also examines the cost of the disease, both in terms of health care and commercial interests, and the steps being taken to curb the epidemic, from

research and screening to cancer management programs and health education.

Issues in Cancer

Epidemiology and Research: 2012 Edition Springer

This volume provides the most comprehensive and authoritative account of cancer epidemiology currently available. The long-awaited Second Edition has been greatly expanded and contains much new material on cancer biology, molecular epidemiology, preventive strategies and specific types and sites of cancer. It represents a systematic updating and expansion of its predecessor, while retaining a similar organization. No other source contains so much information on risk factors for cancer. New chapters describe the emerging methodology and applications of molecular genetics such as the stages in neoplastic development and molecular epidemiology in cancer prevention. The epidemiologic reviews of risk factors and causal mechanisms for specific types of cancer include new sections on anus, vagina, and vulva. Among the other new sections is a chapter on the principles and applications of cancer prevention. A

critical and authoritative review of the complex issues in preventive oncology, this book will be invaluable in planning strategic preventive interventions at the community level, the workplace, the physicians office, or the clinic.

Epidemiology of Childhood

Cancer Springer Science & Business Media

Cancer is low or absent on the health agendas of low- and middle-income countries (LMCs) despite the fact that more people die from cancer in these countries than from AIDS and malaria combined. International health organizations, bilateral aid agencies, and major foundations—which are instrumental in setting health priorities—also have largely ignored cancer in these countries. This book identifies feasible, affordable steps for LMCs and their international partners to begin to reduce the cancer burden for current and future generations. Stemming the growth of cigarette smoking tops the list to prevent cancer and all the other major chronic diseases. Other priorities include infant vaccination against the hepatitis B virus to prevent liver cancers and vaccination to

prevent cervical cancer.

Developing and increasing capacity for cancer screening and treatment of highly curable cancers (including most childhood malignancies) can be accomplished using "resource-level appropriateness" as a guide. And there are ways to make inexpensive oral morphine available to ease the pain of the many who will still die from cancer.

Epidemiological Approaches to the Study of Cancer and Other Chronic Diseases
Springer

Cancer touches the lives of millions worldwide each year. This is reflected not only in well-publicized mortality statistics but also in the profound - though much more difficult to measure - effects of cancer on the health-related quality of life, economic status, and overall well-being of patients and their families. In 2001, the US National Cancer Institute established the Cancer Outcomes Measurement Working Group to evaluate the state of the science in measuring the important and diverse impacts of this disease on individuals and populations. The findings and recommendations of the working group's 35 internationally recognized members are reported in *Outcomes Assessment in Cancer*, lucidly written and accessible to both researchers and policy makers in academia, government, and industry.

Originally published in 2005, this volume provides a penetrating yet practical discussion of alternative approaches for comprehensively measuring the burden of cancer and the effectiveness of preventive and therapeutic interventions.

The Epidemiology of Cancer Oxford University Press, USA
Cancer is the second commonest cause of death, after accidents, among children in developed countries, while in developing countries, improvements in the control of communicable diseases and the occurrence of premature delivery may lead to the emergence of cancer in children as a greater public health problem than in the past. The rationale for considering childhood cancers separately from cancers in adults in that

there are differences in the sites of occurrence, in the histological appearance and in their clinical behavior. This book reviews the epidemiology of specific types of childhood cancer to mid-1997. The scale of the problem is first reviewed in a major compilation of data on the descriptive epidemiology of childhood cancer, then separate chapters describe studies of the different postulated causal factors and summarize what can be concluded from them.
