Mathematics can be very boring!! Passing out mundane worksheets that do not bridge connections is a waste of time.

As mathematics educators, we struggle to find projects or activities that engage students; this is one that does. I currently start this project on the first day of school every year. Students have always enjoyed manipulating the cars, ramps, or photogates to gather the data needed. The way this project integrates Algebra 1, Algebra 2, and Statistics has been great with regards to the "'connections' made. Where students have previously struggled with seeing how different content or subjects tie together, they are able to do so throughout the duration of this curriculum. Take your time with this project, please read throughout it, use the resources I provided, and just enjoy it. I have fun with this project every year and I know you will too. P.S - A Car and Ramp set must be purchased for this curriculum to be effective. Mr. Gregory P. Lakey

Our understanding of the fundamental processes of the natural world is based to a large extent on partial differential equations (PDEs). The second edition of *Partial Differential Equations* provides

an introduction to the basic properties of PDEs and the ideas and techniques that have proven useful in analyzing them. It provides the student a broad perspective on the subject, illustrates the incredibly rich variety of phenomena encompassed by it, and imparts a working knowledge of the most important techniques of analysis of the solutions of the equations. In this book mathematical jargon is minimized. Our focus is on the three most classical PDEs: the wave, heat and Laplace equations. Advanced concepts are introduced frequently but with the least possible technicalities. The book is flexibly designed for juniors, seniors or beginning graduate students in science, engineering or mathematics.
