Techniques explained include EVA, newer hybrid valuation techniques, and relative multiple analysis.

The Equity Edge BAJIKAR TECH INVESTOR Diploma Thesis from the year 2008 in the subject Business economics - Investment and Finance, grade: 2,0, University of Applied Sciences Essen, language: English, abstract: Historically considered, fundamental and technical analyses have always competed, often leading to advocates that ideologically judge either a fundamental analysis or technical analysis to be the one and only analyzing concept. Behavioral finance is a relatively new scientific approach to explain psychological anomalies on

the stock market, but is also more and more often considered to be able to compete with both fundamental and technical analyses. Still, do these analysis concepts really compete in practice or could they actually supplement each other with their respective strengths? Taking the turbulent stock market phases as well as these unanswered questions about fundamental analysis, behavioral finance and the technical analysis into consideration, this thesis ultimately pursues two general objectives: Firstly, fundamental analysis, behavioral finance and technical analysis should be scientifically examined in terms of their premises, analysis approaches, empirical evidences as well as strengths and weaknesses. Secondly, it should be examined as to whether the fundamental analysis, behavioral finance and technical analysis have theoretical and practical synthesis capabilities that could be used for developing a synthesis concept. The synthesis concept should combine the respective strengths and eliminate the respective weaknesses of each of the three analysis concepts. Fundamental analysis, behavioral finance and technical analysis are examined in detail. Empirical studies should prove if, and by which approaches, the analysis concept is able to predict future stock prices. In order to be able to develop a synthesis concept, each analysis concept is evaluated by a SWOT analysis, pursuing the objective of determining the respective strengths, weaknesses, opportunities and threats of the

Stock Analysis in the Twenty-First Century and Beyond For years, financial analysts have struggled with the fact that practically all the financial measures used to analyze corporate performance lack predictive power when it comes to forecasting the market performance of the company’s stock. Numerous academic studies have documented and reported this lack of predictability. Correlation coefficients close to zero have been reported for the relationship between stock market performance and such critical financial measures as earnings growth, sales growth, price/earnings ratio, return on equity, intrinsic value (models based on discounted cash flow or dividends), and many more. It is this disconnect between traditional financial measures and the performance of stocks in the marketplace that has led to the now-famous efficient market hypothesis, the cornerstone of modern portfolio theory. To accept the idea that the future performance of stocks is unpredictable is to say that nothing a company does will affect the future performance of its stock in the market, and that is absurd. It would be more accurate to say that everything a company does will affect the future performance of its stock in the market. The problem with this statement is that it makes the forecasting of future stock performance so complex that it removes it from the realm of human solution. Confident in the belief that something other than chance and irrational investors determine future stock prices, several

research groups around the world have started exploring the use of intelligent computer programs (programs that self-organize based on environmental feedback). Early results are very promising and have provided a glimpse of the economic forces described by Adam Smith as the invisible hand that guides economic activity. *Stock Analysis in the Twenty-First Century and Beyond* describes the stock analysis problem and explores one of the more successful efforts to harness the new intelligent computer technology. Many people mistakenly classify Artificially Intelligent (AI) computer systems as a form of quantitative analysis. There are two distinct differences between advanced AI systems and traditional quantitative analysis. They are (1) who makes up the selection rules and weighting and (2) what information is used to discriminate between good- and poor-performing securities. In most quantitative systems, even in an advanced expert system form, humans make up the investment rules and mathematically derive the weightings associated with the rules. Computer systems that depend on outside human intelligence to program their actions are not inherently intelligent. In advanced AI systems, the computer makes up its own rules and weightings. The computer learns from examples of good- and poor-performing stocks and determines its own ways for discriminating between them. The procedures that are derived by the computer are often so complex that they defy human understanding. In addition to making up its own rules, advanced AI systems look at corporate financial data differently. Just like in the human brain, where information is not stored in the brain cells but rather in the connections and relationships between cells, so too is corporate performance information stored in the relationships between financial numbers. Assessing the performance of companies is not so much in the numbers as it is in the connections between the numbers. Financial analysts recognized this early on and have used first-order relational information in the form of financial ratios for many years (price/book, debt/equity, current assets / current liabilities, price/earnings, etc.). Now with advanced AI systems, we are finally able to look at and evaluate high-order interrelationships in financial data that have been far too complex to analyze with less sophisticated systems. These then are the fundamental differences between what has been used in the past and what will be used in the future. Cdr. Thomas E. Berghage

Fundamental Analysis, Behavioral Finance and Technical Analysis on the Stock Market Penguin

This book describes an equity research approach which combines principles of value investing with domain specific expertise in the technology industry. The book also provides an overview of the financial services industry and the different types of conflicts of interest that drive market participants toward objectives that may not be aligned with those of the individual investor. The book describes an equity research process that I have followed throughout my career as a financial analyst, and shows that equity research is difficult not just for the technical skills involved but also due to behavioral issues that one has to deal with quite frequently when it comes to investing. Equity Research takes a lot of work - much more than an individual investor is likely to be able to commit given that her main profession is probably something other than investing. A central message of the book is for the individual investor to find an independent investment manager who she can trust to pursue an investment strategy that is aligned with her goals.

Based on a 'free of survivorship-bias' sample of German stocks listed at the Frankfurt stock exchange, the study investigates the ability of hedge portfolio formation structures, built of three value premium proxies (P/B, P/E, and DY), the size factor, and the technical momentum factor, to generate excess returns in the period 1992 to 2011. First, the author characterizes and defines the significant terms that are in connection with value and growth investing. He continues with the discussion of asset pricing with the CAPM, the Fama and French three-factor model, and the Carhart extension, and then describes the expected stock returns that are of capital importance. Moreover, the author deals with related studies for the German stock market. He gives a detailed description of the empirical analysis before he draws his conclusions. The author's purpose is to answer the following core questions: Is there a value premium in the German market between 1992 and 2011? Is there a reversed size premium like recent empirical findings suggest? Do high momentum stocks perform better than low momentum stocks? Is there a significant seasonal pattern in hedge portfolio returns? The combination of which factors best explains expected stock returns?

Bachelor Thesis from the year 2012 in the subject Business economics - Business Management, Corporate Governance, grade: 1,00, EBS European Business School gGmbH, language: English, abstract: Portfolio managers face the challenge to achieve excess returns comparative to a benchmark for their private or institutional clients. Researchers such as Fama and French (1992, 1996) or Lakonishok, Shleifer, and Vishny (1994) caused a stir with their findings that various investment styles tend to accomplish superior returns over a long-term horizon. Their findings proposed that value stocks tend to outperform growth stocks. This bachelor thesis raises the question whether value or growth fund managers are able to achieve a persistent outperformance relative to their internal and external benchmark. The findings have a crucial influence on investors considering an investment into the equity market by an active or passive portfolio management approach.
