Among the most prevalent and personally devastating psychological disorders the development of a cognitive approach to obsessive compulsive disorder (OCD) has transformed our understanding and treatment of it. In this highly practical and accessible book, Jonathan Abramowitz presents a model of OCD grounded in the most up-to-date research that incorporates both cognitive and behavioral processes. He then offers a step-by-step guide to psychological treatment that integrates psychoeducation, cognitive techniques, and behavioral therapy (exposure and response prevention). Unlike other manuals for the treatment of OCD, this book teaches the reader how to tailor the choice of techniques and delivery modes for individuals presenting with a wide range of specific OCD symptoms, such as contamination fears and cleaning rituals, fears of harm and compulsive checking, symmetry and ordering, and severe obsessions with mental rituals. The techniques are illustrated with numerous case examples; clinical forms and handouts are provided for use with patients. A final chapter suggests strategies for overcoming common obstacles in treatment.

This handbook begins with the history of Supply Chain (SC) Engineering, it goes on to explain how the SC is connected today, and rounds out with future trends. The overall merit of the book is that it introduces a framework similar to sundial that allows an organization to determine where their company may fall on the SC Technology Scale. The book will describe those who are using more historic technologies, companies that are using current collaboration tools for connecting their SC to other global SCs, and the SCs that are moving more towards cutting edge technologies. This book will be a handbook for practitioners, a teaching resource for academics, and a guide for military contractors. Some figures in the eBook will be in color. Presents a decision model for choosing the best Supply Chain Engineering (SCE) strategies for Service and Manufacturing Operations with respect to Industrial Engineering and Operations Research techniques Offers an economic comparison model for evaluating SCE strategies for manufacturing outsourcing as opposed to keeping operations in-house Demonstrates how to integrate automation techniques such as RFID into planning and distribution operations Provides case studies of SC inventory reductions using automation from AIT and RFID research Covers planning and scheduling, as well as transportation and SC theory and problems

This Research Topic is dedicated to Raja Parasuraman who unexpectedly passed on March 22nd 2015. Raja Parasuraman's pioneering work led the emergence of Neuroergonomics as a new scientific field. He combined his research interests in the field of Neuroergonomics which he defined as the study of the human brain in relation to performance at work and everyday settings. Raja Parasuraman was a pioneer, a truly exceptional researcher and an extraordinary person. He made significant contributions to a number of disciplines, from human factors to cognitive neuroscience. His advice to young researchers was to be passionate in order to develop theory and knowledge that can guide the design of technologies and environments for people. His legacy, the field of Neuroergonomics, will live on in countless faculties and students whom he advised and inspired with unmatched humility throughout the whole of his distinguished career. Raja Parasuraman was an impressive human being, a very kind person, and an absolutely inspiring individual who will be remembered by everyone who had the chance to meet him. About this Research Topic Since the advent of neuroergonomics,

significant progress has been made with respect to methodology and tools for the investigation of the brain and behavior at work. This is especially the case for neuroscientific methods where the availability of ambulatory hardware, wearable sensors and advanced data analyses allow for imaging of brain dynamics in humans in applied environments. Methods such as: electroencephalography (EEG), functional near-infrared spectroscopy (fNIRS), and stimulation approaches like transcranial direct-current stimulation (tDCS) have made significant progress in both recording and altering brain activity while allowing full body movements outside laboratory environments. For neuroergonomics, the application of brain imaging in real-world scenarios is highly relevant. Traditionally, brain imaging experiments in human factors research tend to avoid active behavior for fear of artifacts and a contaminated data set that would provide limited insight into brain dynamics in real working environments. To overcome these problems new analyses approaches have to be developed that identify artifacts resulting from hostile recording environments and movement-related non-brain activity stemming from eye-, head, and full-body movements. The application of methodology from the field of Brain-Computer Interfacing (BCI) for neuroergonomics is one approach that has significant potential to enhance ambulatory monitoring and applied testing. Passive BCIs allow for assessing aspects of the user state online, such that systems can automatically adapt to their user. This neuroadaptive technology could lead to highly efficient working environments, to auto-adaptive experimental paradigms and to a continuous tracking of cognitive and affective aspects of the user state. Hence, deployment of portable neuroimaging technologies to real time settings could help assess cognitive and motivational states of personnel assigned to perform critical tasks. This Research Topic gathers submissions that cover new approaches in neuroergonomics. Different article type cover advanced neuroscience methods and neuroergonomics techniques as well as analysis approaches to investigate brain dynamics in working environments. The selection of papers provides insights into new neuroergonomic research approaches that demonstrate significant advances in brain imaging technologies that become more and more mobile. Moreover, a strong trend for new analyses approaches and paradigms investigating real work settings can be seen. Together, this unique collection of latest research papers provides a comprehensive overview on the latest developments in neuroergonomics.

ERP: Making It Happen Walter de Gruyter GmbH & Co KG

"This book is an ethnographic investigation of the everyday professional lives of experimental cognitive psychologists, aimed at conveying to readers a sense of the social world of the laboratory, and explaining how the field produces knowledge about human cognition. Emily Martin did fieldwork in three labs conducting research in normal human cognition. In the early days of her fieldwork, Martin was struck by how irrelevant her own subjective experience was to the experimenters. What researchers conducting the experiments were seeking was data about how her brain responded to stimuli such as photographs and videos. Her own responses to the situation -- the set-up of the experiment, etc -- were very much beside the point. This led Martin to wonder when, in the history of this field, introspection and related "messy" data concerning the social conditions of lab experimentation came to be expelled. Her book examines this history, provides a comparison with the history of her own field (anthropology), and discusses the evolution of a pillar of contemporary experimental cognitive psychology, the psychological experiment. In the course of this book Martin reports on her discussions with practicing experimental psychologists about the efficacy of placing persons in such unusual settings in the search for general knowledge. What emerges is an account of the cognitive psychology experiment as an artificial construction in which a certain kind of knowledge is produced and a certain kind of human subject is created. But this book is not a "debunking" of the discipline of experimental cognitive psychology. Martin readily acknowledges the fact that real knowledge is produced in these highly-structured and artificial experimental settings. She does, however, question the tendency within this discipline to dismiss the significance of the social and cultural setting of the formal psychological experiment, and argues that the field promotes a truncated view of the human subject and its capacities"--
