Scientific Essay from the year 2016 in the subject Medicine - Public Health, grade: 1, Egerton University, language: English, abstract: Treatment of diabetes has become relatively efficient with the emergence of nutritional remedies. In the old days, people who suffered from diabetes died, owing to the adverse consequences of the disease conditions because there was no reliable treatment. Thereafter, insulin therapy was initiated and this seemed to alleviate diabetic conditions. Today, there are quite a number of approaches that help to treat diabetes, and one of the most principal approaches is clinical nutrition, in which, diabetic patients are put on a prescribed dietary regime and herbs to regulate blood sugar. Diabetes, which is characterized by polydipsia, polyuria and polyphagia conditions, is posing threat to mankind, although their severity depends on whether one is suffering from Type 1 or Type 2 diabetes. Currently, about 6.3% of the U.S population is suffering from diabetes. Globally, it is estimated that 171 million people suffer from the disease (CDC, 2003). As a result, the WHO has turned to nutritional remedies to increase treatment efficacy and reduce cost. To this effect, the question is 'Does Clinical Nutrition Treat Diabetes Effectively?' This essay gives an overview on diabetes then focus on alternative therapies, and the role of medicine to support this kind of treatment.

Essay 1 investigates whether dietary choice links with physical activity, obesity, type 2 diabetes mellitus and medication usages for these two diseases. To measure consumers dietary choice, this essay employs yearly expenditure shares of six food categories, including fruits and vegetables, snacks and chips, yogurts, regular soft drinks, diet soft drinks and bottled water. The model is Ordinary Least Square models of expenditure share of one food category against physical activity, obesity or type 2 diabetes. Essay 1 finds that the physically active individuals spend more of their grocery budget on fruits and vegetables and yogurts and spend less snacks and chips, regular soft drinks and diet soft drinks on average than the physically inactive ones. The endogeneity of physical activity affects the regression results for some food categories. It also finds that the dietary pattern of obese individuals are less healthy than that of nonobese individuals. However, when considers the usage of medications for obesity and a mixed method for obesity identification (i.e. identify obesity with self-reported survey and BMI 30), the results are mixed. For the model of type 2 diabetes, the expenditure share of a food category is driven by both medication usage and nutrition facts of the food category. Essay 2 investigates the associations between consumer demand on yogurts and physical activity and obesity. I consider a mixed multinomial logit model with random coefficients for price and product attributes. Essay 2 finds that individuals who do exercise some days in a week are the most price sensitive on average, followed by the individuals who do exercise most days in a week and the ones who rarely or never exercise. Physically active individuals, on average, prefer healthy yogurts such as plain yogurts and Greek yogurts. It also finds that the individuals whose BMI 30 (i.e. obese or overweight) are more price sensitive and prefer yogurts with more sugar and protein and less total fat on average than the ones whose BMI

What do Czech heritage, beer, and diabetes have in common? They are all inside me. No, not all the time, but I'll be diabetic until there is a cure. As a result of a trip to Prague and with the help of a Czech historian, we have traced the Stein family back to the 18th century. And, beer is a subject that I simply must write about. Last semester a professor of fiction asked me, "if your last name was Shot would you write about whiskey?" He said it offhandedly, though seriously because many of my fiction assignments, or "pastiches," were written around beer. They were scenes about brewers, people in European fields harvesting hops, and an immigrant looking over a body of water, the Potomac, that would inevitably be used in his brewing. It was hard for me to write about anything else, though I did end the semester by creating a piece of fiction about my great grandmother who had perished in the Nazi-run Czech concentration camp, Terezin. In the following collection of seven essays I write about beer, health, genealogy and its intersection with history and religion. My first essay Bohemia, is a chronicling of Czech lands and four generations of Steins, with religion and history providing the backdrop. Where Bohemia charts the course of religion back to the 9th century, the second essay Crossing the Vltava, is a peak into the lives of my grandfather, my father, and myself. The third piece, Knock on the Cellar Door, is a narrative of creative nonfiction; it also focuses on the lives of my father and grandmother who survived the Nazi occupation of Prague. Zofie is an essay about my great grandmother, the first and only known diabetic in the Stein family. My Type 1 is another essay that deals with diabetes, particularly with my kind of diabetes, type 1 insulin-dependent diabetes. Hops to Save The Day traces the history of the first production brewery in the District of Columbia in the 21st century. Finally, The Quest for Heurich's Lager is my quest as a homebrewer and beer historian to recreate DC's indigenous drink, returning to the influence of Bohemia on DC's beer.

From the best-selling author of *Why We Get Fat*, a groundbreaking, eye-opening exposé that makes the convincing case that sugar is the tobacco of the new millennium: backed by powerful lobbies, entrenched in our lives, and making us very sick. Among Americans, diabetes is more prevalent today than ever; obesity is at epidemic proportions; nearly 10% of children are thought to have nonalcoholic fatty liver disease. And sugar is at the root of these, and other, critical society-wide, health-related problems. With his signature command of both science and straight talk, Gary Taubes delves into Americans' history with sugar: its uses as a preservative, as an additive in cigarettes, the contemporary overuse of high-fructose corn syrup. He explains what research has shown about our addiction to sweets. He clarifies the arguments against sugar, corrects misconceptions about the relationship between sugar and weight loss; and provides the perspective necessary to make informed decisions about sugar as individuals and as a society.

Essay from the year 2016 in the subject Medicine - Epidemiology, grade: 1, Egerton University, language: English, abstract: This research paper will provide an overview of diabetes in Qatar.

Diabetes in Qatar has seemingly become an enormous challenge to public healthcare systems. Qatar is one of the GCC countries which are known to have the highest diabetes incidence rates. In a global ranking, Qatar is ranked six whereas the United Arab Emirates and Saudi Arabia who are members of the GCC countries are ranked second and third, respectively in regard to incidence rates of diabetes. Current epidemiological reports indicate that an estimated 16 percent of the adult population in Qatar is suffering from diabetes, in which type 2 diabetes is the most prevalent compared to type 1 diabetes. However, other clinical reports indicate that diabetes prevalence among children below the age of five years in Qatar has also assumed upward trends. For instance, prevalence rate for diabetes among children was reported to be 13.7% in 1997, but this rate has more than doubled to reach 28.2% in 2007. From an epidemiological perspective, the burden of diabetes to Qatar's healthcare system seems to be overwhelming. Therefore, it has become a significant concern in community health nursing because the number of Qatari diabetic patients seeking for medical treatment has increased significantly. This situation has been worsened by the rising trends of obesity prevalence rates. Currently, 45% of the population in Qatar is obese in which 55% of diabetic patients are obese. Therefore, this correlation in incidence and prevalence rates of the two diseases complicates prevention and health promotion measures in Qatar. As a result, Qatar's efforts to reduce the prevalence of diabetes have been faced with enormous challenges. However, the country is optimistic that the Qatar Diabetes Project and Stem Cell Projects will be successful. In regard to the risk factors, the unprecedented increase of diabetes prevalence is attributable to lifestyle and genetic factors. Clinical studies reveal that most people in Qatar have changed their cultural lifestyle to western-related lifestyle, and this is believed to have contributed significantly to the current diabetes crisis. In general, diabetes issue in Qatar needs appropriate epidemiological measures to reduce its burden to the country's healthcare system in which social health determinants and epidemiological indicators will help in addressing the issue.

[I Reversed My Type 2 Diabetes And You Can Too...](#) Little, Brown

"Diabetes is a serious, chronic disease that occurs either when the pancreas does not produce enough insulin (a hormone that regulates blood sugar, or glucose), or when the body cannot effectively use the insulin it produces. Diabetes is an important public health problem, one of four priority noncommunicable diseases (NCDs) targeted for action by world leaders. Both the number of cases and the prevalence of diabetes have been steadily increasing over the past few decades. Globally, an estimated 422 million adults were living with diabetes in 2014, compared to 108 million in 1980. The global prevalence (age-standardized) of diabetes has nearly doubled since 1980, rising from 4.7% to 8.5% in the adult population. This reflects an increase in associated risk factors such as being overweight or obese. Over the past decade, diabetes prevalence has risen faster in low- and middle-income countries than in high-income countries. Diabetes caused 1.5 million deaths in 2012. Higher-than-optimal blood glucose caused an additional 2.2 million deaths, by increasing the risks of cardiovascular and other diseases. Forty-three percent of these 3.7 million deaths occur before the age of 70 years. The percentage of deaths attributable to high blood glucose or diabetes that occurs prior to age 70 is higher in low- and middle-income countries than in high-income countries. Because sophisticated laboratory tests are usually required to distinguish between type 1 diabetes (which requires insulin injections for survival) and type 2 diabetes (where the body cannot properly use the insulin it produces), separate global estimates of diabetes prevalence for type

1 and type 2 do not exist. The majority of people with diabetes are affected by type 2 diabetes. This used to occur nearly entirely among adults, but now occurs in children too."--Page 6.

Providing the most up-to-date research and current clinical knowledge of diabetic bone disease and the challenges still facing the research and clinical care communities, this book unites insights from endocrinology and orthopedics to create a truly unique text. The first part covers clinical and pre-clinical applications and research. The first two chapters present the clinical and epidemiological data about diabetic bone disease, evaluated and reviewed for type 1 and type 2, respectively. This is followed by discussions of how the propensity to fracture in diabetic bone disease can impact fracture risk assessments and how it can be adjusted for using current clinically relevant fracture risk models. A comprehensive overview of orthopedic complications observed in diabetes is next, as well as a focus on the consequences of diabetes on periodontal disease. Other topics include the utility of skeletal biomarkers in assessing diabetic bone disease, how drugs used to treat diabetes may also have skeletal consequences, and the possibility that diabetes may fundamentally impact early progenitor cells of various bone lineages and thus globally impact bone. The second part covers biomechanics and bone quality in diabetes: how diabetes ultimately may impact the architecture, integrity, and quality of bone. Utilizing the expertise of top researcher and clinicians in diabetic bone disease in one comprehensive text, this volume will be a useful and thought-provoking resource for endocrinologists and orthopedic surgeons alike.

As the number of patients with diabetes increases annually, it is not surprising that the number of patients with diabetes who are admitted to the hospital also increases. Once in the hospital, patients with diabetes or hyperglycemia may be admitted to the Intensive Care Unit, require urgent or elective surgery, enteral or parenteral nutrition, intravenous insulin infusion, or therapies that significantly impact glycemic control (e.g., steroids).

Because many clinical outcomes are influenced by the degree of glycemic control, knowledge of the best practices in inpatient diabetes management is extremely important. The field of inpatient management of diabetes and hyperglycemia has grown substantially in the last several years. This body of knowledge is summarized in this book, so it can reach the audience of hospitalists, endocrinologists, nurses and other team members who take care of hospitalized patients with diabetes and hyperglycemia.
