In this paper, a load flow analysis is performed to a 138/69 kV substation using ETAP software (shortner for Electrical Transient & Analysis Program). The scope of this report encompasses the load flow results, and explains how these were used to implement changes on the feeders that resulted in an improved voltage profile. Electrical Transient

Analyzer Program (ETAP)

The ITER Project selected ETAP as the electrical analysis tool for several reasons.

The U.S. nuclear qualification ensures high level of quality.

Moreover, in an international environment like ITER, ETAP demonstrated a high level of support in all the countries involved in the project.

ETAP: Electrical Transient Analysis Programme

The Electrical Transient Analyzer Program (ETAP) is an electrical engineering program that provides a base

program with optional modules that allow the user to preform modeling, design, analysis, optimization, monitoring, control, and automation of electrical power systems.
