Malaria remains an important cause of illness and death in children and adults in countries in which it is endemic. Malaria control requires an integrated approach including prevention (primarily vector control) and prompt treatment with effective antimalarial agents. Malaria case management consisting of prompt diagnosis and effective treatment remains a vital component of malaria control and elimination strategies. Since the publication of the first edition of the Guidelines for the treatment of malaria in 2006 and the second edition in 2010 all countries in which *P. falciparum* malaria is endemic have progressively updated their treatment policy from use of ineffective monotherapy to the currently recommended artemisinin-based combination therapies (ACT). This has contributed substantially to current reductions in global morbidity and mortality from malaria. Unfortunately resistance to artemisinins has arisen recently in *P. falciparum* in South-East Asia which threatens these gains. This third edition of the WHO Guidelines for the treatment of malaria contains updated recommendations based on a firmer evidence base for most antimalarial drugs and in addition include recommendation on the use of drugs to prevent malaria in groups at high risk. The Guidelines provide a framework for designing specific detailed national treatment protocols taking into account local patterns of resistance to antimalarial drugs and health service capacity. It provides recommendations on treatment of uncomplicated and severe malaria in all age groups all endemic areas in special populations and several complex situations. In addition on the use of antimalarial drugs as preventive therapy in healthy people living in malaria-endemic areas who are high risk in order to reduce morbidity and mortality from malaria. The Guidelines are designed primarily for policy-makers in ministries of health who formulate country-specific treatment guidelines. Other groups that may find them useful include health professionals and public health and policy specialists that are partners in health or malaria control and the pharmaceutical industry. The treatment recommendations in the main document are brief; for those who wish to study the evidence base in more detail a series of annexes is provided with references to the appropriate sections of the main document.

Malaria is an important cause of death and illness in children and adults in tropical countries, and the mortality rate (which is currently estimated at over a million people per year) has risen in recent years, probably due to increasing resistance to antimalarial medicines. Malaria control requires an integrated approach which covers both prevention (including vector control) and treatment with effective antimalarials. This publication sets out guidelines to help formulate policies and protocols for the treatment

of malaria based on sound evidence that can be applied effectively in most settings. Chapters cover: treatment objectives, diagnosis of malaria, resistance to antimalarial medicines, antimalarial treatment policy, treatment of uncomplicated and severe P.falciparum malaria, treatment of P.vivax, P.ovale or P.malariae malaria, mixed malaria infections, complex emergency situations and epidemics.

Thyroid Diseases in Pregnancy World Bank Publications

Approximately every two minutes a baby dies in the WHO Western Pacific Region. The majority of newborn deaths occur within the first few days, mostly from preventable causes. The high mortality and morbidity rates among newborns are related to inappropriate hospital and community practices that currently occur throughout the Region. Furthermore, newborn care has fallen into a gap between maternal care and child care. This Guide provides health professionals with a user-friendly, evidence-based protocol to essential newborn care--focusing on the first hours and days of life. The target users are skilled birth attendants including midwives, nurses and doctors, as well as others involved in caring for newborns. This pocket book provides a step-by-step guide to a core package of essential newborn care interventions that can be administered in all health-care settings. It also includes stabilization and referral of sick and preterm newborn infants. Intensive care of newborns is outside the scope of this pocket guide. This clinical practice guide is organized chronologically. It guides health workers through the standard precautions for essential newborn care practices, beginning at the intrapartum period with the process of preparing the delivery area, and emphasizing care practices in the first hours and days of a newborn's life. Each section has a color tab for easy reference.

Monitoring Emergency Obstetric Care Gilad James Mystery School

Essential Surgery is the first volume in the Disease Control Priorities, third edition (DCP3) series. DCP3 endeavors to inform program design and resource allocation at the global and country levels by providing a comprehensive review of the effectiveness, cost, and cost-effectiveness of priority health interventions. The volume presents data on the surgical burden of disease, disability, congenital anomalies, and trauma, along with health impact and economic analyses of procedures, platforms, and packages to improve care in settings with severe budget limitations. Essential Surgery identifies 44 surgical procedures that meet the following criteria: they address substantial needs, are cost effective, and are feasible to implement in low- and middle-income countries. If made universally available, the provision of these 44 procedures would avert 1.5 million deaths a year and rank among the most cost effective of all health interventions.

Existing health care delivery structures can be leveraged to provide affordable and quality care, with first-level hospitals capable of delivering the majority of procedures, while addressing substantial disparities in safety. Existing infrastructure can also expand access to surgery by implementing measures such as task sharing, which has been shown to be safe and effective while countries build workforce capacity. Nearly ten years after the second iteration of Disease Control Priorities was released, increased attention to the importance of health systems in providing access to quality care is once again reshaping the global health landscape. Low- and middle-income countries are continuing to set priorities for funding and are making decisions across an increasingly complex set of policy and intervention choices with a greater appreciation for the value of program and economic evaluations. By reviewing the large burden of surgical disorders, the cost-effectiveness of surgical procedures, and the strong public demand for surgical services, Essential Surgery makes a compelling case for improving global access to surgical care.

Health indicators particularly on child health and malaria in Ethiopia have improved significantly in recent years, with the next challenge now focused on improving maternal health indicators. Improvements in Child health and Malaria in particular can be attributed to strong government commitment towards health results in the country, reflected in a number of notable policies and programs related to Human Resources for Health (HRH), in particular the health extension worker program. However, indicators related to maternal health, remain problematic. Ethiopia has one of the lowest levels of assisted deliveries in the region. Although increases in the number of health workers particularly in rural areas may have contributed to improving access to some health services, it is in the government's interest to further improve the stock, distribution and performance of relevant health workers in Ethiopia, particularly to bring about improvement in access to maternal health services for the poor. This document reviews the current HRH situation in Ethiopia, summarizes the evidence on population use of select health services, and offers relevant policy options to assist the government finalize its new Human Resources Strategy and address remaining health challenges.
