Evaluation and Management Coding Reference Guide - First Edition Jones & Bartlett Learning

Since the publication of the Institute of Medicine (IOM) report *Clinical Practice Guidelines We Can Trust* in 2011, there has been an increasing emphasis on assuring that clinical practice guidelines are trustworthy, developed in a transparent fashion, and based on a systematic review of the available research evidence. To align with the IOM recommendations and to meet the new requirements for inclusion of a guideline in the National Guidelines Clearinghouse of the Agency for Healthcare Research and Quality (AHRQ), American Psychiatric Association (APA) has adopted a new process for practice guideline development. Under this new process APA's practice guidelines also seek to provide better clinical utility and usability. Rather than a broad overview of treatment for a disorder, new practice guidelines focus on a set of discrete clinical questions of relevance to an overarching subject area. A systematic review of evidence is conducted to address these clinical questions and involves a detailed assessment of individual studies. The quality of the overall body of evidence is also rated and is summarized in the practice guideline. With the new process, recommendations are determined by weighing potential benefits and harms of an intervention in a specific clinical context. Clear, concise, and actionable recommendation statements help clinicians to incorporate recommendations into clinical practice, with the goal of improving quality of care. The new practice guideline format is also designed to be more user friendly by dividing information into modules on specific clinical questions. Each module has a consistent organization, which will assist users in finding clinically

useful and relevant information quickly and easily. This new edition of the practice guidelines on psychiatric evaluation for adults is the first set of the APA's guidelines developed under the new guideline development process. These guidelines address the following nine topics, in the context of an initial psychiatric evaluation: review of psychiatric symptoms, trauma history, and treatment history; substance use assessment; assessment of suicide risk; assessment for risk of aggressive behaviors; assessment of cultural factors; assessment of medical health; quantitative assessment; involvement of the patient in treatment decision making; and documentation of the psychiatric evaluation. Each guideline recommends or suggests topics to include during an initial psychiatric evaluation. Findings from an expert opinion survey have also been taken into consideration in making recommendations or suggestions. In addition to reviewing the available evidence on psychiatry evaluation, each guideline also provides guidance to clinicians on implementing these recommendations to enhance patient care.

Lippincott Williams & Wilkins Comprised of illustrative clinical cases, this unique pocket guide presents descriptions of patients who have symptoms, physical signs or laboratory abnormalities that they believe are due to disorders of the endocrine system (hormone secreting glands and overall metabolism) but which are not, or probably are not, due to an endocrine disorder. These are common situations in the clinical practice of endocrinology. Each chapter includes clinical cases illustrating differing presentations and outcomes, and each individual case description is followed by a discussion that includes the differential diagnosis of these symptoms, signs and/or lab abnormalities and why they are not likely due to endocrine disease or, alternatively, why and how a deeper exploration for endocrine disorders might be needed. In all cases, an emphasis is placed on listening to the patient and providing a respectful and compassionate response and approach to evaluation and management of the proposed disorder. Discussions are referenced whenever reference material is available, and evidence-based clinical practice guidelines are presented whenever applicable. Topics discussed include chronic and adrenal fatigue, obesity, anxiety and depression, sweating and flushing, alcohol- and opioid-induced symptoms, low testosterone, pseudo-hypoglycemia and pseudo-Cushing's syndrome, among others. Clinical endocrinologists, primary care physicians and related allied

medical professionals will find Management of Patients with Pseudo-Endocrine Disorders a valuable resource in their clinical practice with these common but often challenging patients.
