In 1987 Ken Ham wrote what would become a prophetic warning to the Church about the destructive effects of compromise with evolutionary ideas, and how this compromise undermines Scriptural authority and erodes Christian confidence in the infallibility of God's Word. Today we have Christians not only confused when it comes to Genesis and age of the earth, but even the reality of Hell, Adam as a real person, and Christ's own words about creation, marriage and more are being debated in the pulpits across the world. In this special revised and updated edition, Ken Ham again takes the lead in pointing out the looming precipice the Church is rushing towards, how evolution and/or millions of years, is driving away young people of the faith, and the biblical solution that can change it! *Communicating the Controversy* McGraw-Hill Science, Engineering & Mathematics

Pastor and author Martin Thielen has compiled a list of ten things people need to believe, and ten things they don't, in order to be a Christian. This lively and engaging book will be a help to seekers as well as a comfort to believers who may find themselves questioning some of the assumptions they grew up with. With an accessible, storytelling style that's grounded in solid biblical scholarship, Thielen shows how Christians don't need to believe that sinners will be "left behind" to burn in hell or that it's heresy to believe in evolution. And while we must always take the Bible seriously, we don't always have to take it literally. At the same time, Christians do need to believe in Jesus--his life, his teachings, his death and resurrection, and his vision for the world. A great benefit of those beliefs is that they provide promising answers to life's most profound questions, including: Where is God? What matters most? What brings fulfillment? What about suffering? Is there hope? Thielen articulates centrist, mainline Christianity in a way that's fresh and easy to understand, and offers authentic Christian insights that speak to our deepest needs. This new edition includes a leader's guide, previously only available online, and a new introduction from the author that reflects on the book's reception. The leader's guide features unique and easily implemented aids for carrying out a seven-week, congregation-wide initiative that will help local churches reach out to their communities. Evolution in Age-Structured Populations New Leaf Publishing Group
Thirty years ago, biologists could get by with a rudimentary grasp of mathematics and modeling. Not so today. In seeking to answer

fundamental questions about how biological systems function and change over time, the modern biologist is as likely to rely on sophisticated mathematical and computer-based models as traditional fieldwork. In this book, Sarah Otto and Troy Day provide biology students with the tools necessary to both interpret models and to build their own. The book starts at an elementary level of mathematical modeling, assuming that the reader has had high school mathematics and first-year calculus. Otto and Day then gradually build in depth and complexity, from classic models in ecology and evolution to more intricate class-structured and probabilistic models. The authors provide primers with instructive exercises to introduce readers to the more advanced subjects of linear algebra and probability theory. Through examples, they describe how models have been used to understand such topics as the spread of HIV, chaos, the age structure of a country, speciation, and extinction. Ecologists and evolutionary biologists today need enough mathematical training to be able to assess the power and limits of biological models and to develop theories and models themselves. This innovative book will be an indispensable guide to the world of mathematical models for the next generation of biologists. A how-to guide for developing new mathematical models in biology Provides step-by-step recipes for constructing and analyzing models Interesting biological applications Explores classical models in ecology and evolution Questions at the end of every chapter Primers cover important mathematical topics Exercises with answers Appendixes summarize useful rules Labs and advanced material available
