Governmental needs for census data as well as information about a variety of economic activities provided much of the early impetus for the field of statistics. Currently the need to turn the large amounts of data

Exploratory data
analysis (EDA) is a
very important step
which takes place
after feature
engineering and
acquiring data and
it should be done
before any
modeling. This is
because it is very
important for a
data scientist to
be able to
understand the
nature of the data
without making
assumptions.

Factor analysis is a statistical
method used to describe
variability among observed,
correlated variables in terms of
a potentially lower number of
unobserved variables called
factors. For example, it is
possible that variations in six
observed variables mainly
reflect the variations in two
unobserved (underlying)
variables.

Multivariate Analysis with R -

This page shows how to perform
a number of statistical tests using
SPSS. Each section gives a brief
description of the aim of the
statistical test, when it is used, an
example showing the SPSS
commands and SPSS (often
abbreviated) output with a brief
interpretation of the output. You

In statistics, multiple
correspondence analysis
(MCA) is a data analysis
technique for nominal

categorical data, used to detect and represent underlying structures in a data set. It does this by representing data as points in a low-dimensional Euclidean space. The procedure thus appears to be the counterpart of principal component analysis for categorical data.

Procrustes Analysis process can be input into Principal Components Analysis and projected onto two-dimensional space for easily understood results.. Use in Sensory Profiling. Generalized Procrustes Analysis a way to find an underlying structure in ...

Cluster analysis. One way to visualize multivariate distances is through cluster analysis, a technique for finding groups in data. Cluster analysis produces a tree diagram, or dendrogram, showing the distance relationships among a set of objects, which are placed into groups (clusters).

Exploratory Factor Analysis (EFA) is a statistical technique that is used to identify the latent relational structure among a set of variables and narrow down to smaller number of variables.

Factor analysis - Wikipedia

Analysis of Variance

(ANOVA) is a parametric statistical technique used to compare datasets. This technique was invented by R.A. Fisher, and is thus often referred to as Fisher ' s ANOVA, as well. It is similar in application to techniques such as t-test and z-test, in that it is used to compare means and the relative variance between them.
