A science curriculum editor - and veteran teacher - exposes myths and misconceptions perpetuated by irresponsible science textbooks and offers clear explanations to defrauded

teachers and students. In the fiery politics surrounding the struggles in modern education, one crucial element has eluded criticism: Our day-to-day source materials. People have placed the blame on teachers, students, parents, administrators, funding, and education standards, but little attention has been given to the textbooks on which teachers and students so heavily rely. Teachers and students have reasonable expectation that the state-adopted textbooks are dependable tools they can rely on for accurate accounts of scientific explanations, theories, and facts - yet closer examination has shown that this is decidedly not the case. This is what Richard P. Feynman, winner of the 1965 Nobel Prize in physics, had to say about the textbooks submitted to California for state adoption: "They said things that were useless, mixed-up, ambiguous, confusing, and partially incorrect. How anybody can learn science from these books, I don't know, because it's not science." Have you been misled? Take a short quiz to see:

1. Seatbelt buckles can burn you

on a hot day because metals get hotter than non-metals -True or False? 2. The blood carried by your veins has no oxygen, so it is blue rather than red -True or False? 3. Clouds form when moist air cools because colder air holds less water -True or False? The answer to all three questions is false. In *Science Myths Unmasked*, Rudel adeptly sets straight dozens of commonplace misconceptions with crystal-clear scientific fact. A must-read for science teachers, students, and anyone desiring to reclaim the accurate accounts they deserve but never received.

College Physics McGraw-Hill Education

The main idea of this book is that to comprehend the instructional potential of simulation and to design effective simulation-based learning environments, one has to consider both what happens inside the computer and inside the

students' minds. The framework adopted to do this is model-centered learning, in which simulation is seen as particularly effective when learning requires a restructuring of the individual mental models of the students, as in conceptual change. Mental models are by themselves simulations, and thus simulation models can extend our biological capacity to carry out simulative reasoning. For this reason, recent approaches in cognitive science like embodied cognition and the extended mind hypothesis are also considered in the book.. A conceptual model called the “ epistemic simulation cycle ” is proposed as a blueprint for the comprehension of

the cognitive activities involved in simulation-based learning and for instructional design. Physics of Sport Springer Science & Business Media At a time when scientific and technological competence is vital to the nation's future, the weak performance of U.S. students in science reflects the uneven quality of current science education. Although young children come to school with innate curiosity and intuitive ideas about the world around them, science classes rarely tap this potential. Many experts have called for a new approach to science education, based on recent and ongoing research on teaching and learning. In this approach, simulations and games could play a significant role by addressing many goals and mechanisms for learning science: the motivation to

learn science, conceptual understanding, science process skills, understanding of the nature of science, scientific discourse and argumentation, and identification with science and science learning. To explore this potential, *Learning Science: Computer Games, Simulations, and Education*, reviews the available research on learning science through interaction with digital simulations and games. It considers the potential of digital games and simulations to contribute to learning science in schools, in informal out-of-school settings, and everyday life. The book also identifies the areas in which more research and research-based development is needed to fully capitalize on this potential. *Learning Science* will guide academic researchers; developers, publishers, and

entrepreneurs from the digital simulation and gaming community; and education practitioners and policy makers toward the formation of research and development partnerships that will facilitate rich intellectual collaboration. Industry, government agencies and foundations will play a significant role through start-up and ongoing support to ensure that digital games and simulations will not only excite and entertain, but also motivate and educate. *Experiments with the Sun and the Moon*

Early one morning Arvid finds himself standing outside the bookshop where he used to work, drunk, dirty, with two fractured ribs, and no idea how he came to be there. He does not even recognise his face in the

mirror. It is as if he has dropped out of the flow of life. Slowly, uncontrollably, the memories return to him, and Arvid struggles under the weight of the tragedy which has blighted his life - the death of his parents and younger siblings in an accident six years previously. At times almost unbearably moving, *In the Wake* is nonetheless suffused with unexpected blessings: humour, wisdom, human compassion, and a sense of the perpetual beauty of the natural world. “ Might be just the book to bring out your inner astronomer . . . over 250 pages of breathtaking images from the past 50 years of NASA ’ s space exploration. ” —Parade Preface by Bill Nye This magnificent volume offers a rich visual tour of the planets in our solar system. More than two-hundred breathtaking photographs from the

archives of NASA are paired with extended captions detailing the science behind some of our cosmic neighborhood's most extraordinary phenomena. Images of newly discovered areas of Jupiter, fiery volcanoes on Venus, and many more reveal the astronomical marvels of space in engrossing detail. Anyone with an interest in science, astronomy, and the mysteries of the universe will delight in this awe-inspiring guide to the wonders of the solar system. "As you turn through the pages, you're hit with true moments of awe, photos that remind you the power of nature extends beyond our own planet." —Houston Chronicle

"Breathtaking pictures show the otherworldly magic of the solar system. . . The images are at once humbling and uplifting: Here in the black void of space is Saturn's frozen

moon, Mimas, white and pitted like a galactic golf ball; here is the tiny golden orb called Io, casting a shadow in a perfect inky circle on the marbled surface of Jupiter; here is the great sun, flames spurting from its surface like plumes." —The Wall Street Journal

"[A] gorgeous photographic tour of space . . . The collection is a remarkable reminder of how much has been learned about the planets over the past few decades, solving many mysteries yet introducing many more." —Publishers Weekly

Follow two abolitionists

persistent evils of the

Timothy Ballard. Harriet
Jacobs was an African-
American, born into
slavery in North Carolina
in 1813. She thwarted
the sexual advances of
her master for years until
she escaped and hid in
the attic crawl space of
her grandmother's house
for seven years before

an autobiography of her
life, Incidents in the Life
of a Slave Girl, which
was one of the first open
discussions about sexual
abuse endured by slave

women. She was an active abolitionist, associated with Frederick Douglass, and, during the Civil War, used her celebrity to raise money for black refugees. After the war, she worked to improve the conditions of newly-freed slaves. As a former Special Agent for the Department of Homeland Security who has seen the horrors and carnage of war, Timothy Ballard founded a modern-day "underground railroad" which has rescued hundreds of children from being fully enslaved, abused, or trafficked in third-world countries. His story includes the rescue and his eventual adoption of two young siblings--Mia and Marky, who were born in Haiti. Section 2 features the lives of five abolitionists, a mix of heroes from past to present, who call us to action and teach us life lessons based on their own experiences: Harriet Tubman--The "Conductor"; Abraham Lincoln--the "Great Emancipator"; Little Mia--the sister who saved her little brother; Guesno Mardy--the Haitian father who lost his son to slave traders; and Harriet Jacobs--a teacher for us all.

In *Science Myths Unmasked Volume 2*, David Rudel continues to expose common errors in science education. This sequel takes the discussion into the realm of physical science, rectifying commonly taught misconceptions about topics covered in chemistry and physics courses, including

combustion, simple machines, states of matter, phase changes, electricity, and light. Rudel's accessible style makes *Science Myths Unmasked* a worthwhile read for life-long learners and a great gift for bright high school students interested in all the myths they have been taught by inaccurate textbooks. State-adopted textbooks perpetrate (and perpetuate) a shocking degree of misinformation, largely because they are less interested in conveying accurate science than in training students to bubble in the right oval on multiple-choice, standardized tests. Rudel provides

thorough background for each topic, empowering science teachers to sculpt the material to match the needs of their students. Numerous illustrations and suggested experiments complement the coverage, portraying precisely why many standard explanations are false and how we can better fulfill our obligation to provide genuine science to middle school and high school students.
