The authors of this book examine the British National Curriculum from several different perspectives and concentrate on various subject areas. The uniting theme between these essays is the argument that the subjects in the school curriculum used to be regarded as discrete areas of knowledge which would be imparted to pupils by teachers motivated by a love of learning, but that this has not been enough for recent governments who see schools as a means of promoting social and political goals that may or may not relate to traditional academic disciplines. The contributors to this book argue that we need to return to the traditional view of education as a means of transmitting a body of knowledge from one generation to the next, and that academic rigour and respect for the professionalism of teachers should take precedence over political manipulation of the curriculum.

The importance of investigating karstified aquifers lies in their significance as a major source of drinking water. This book describes methods that are basic to all hydrogeological studies, such as hydraulic investigations, hydrochemistry, geophysics, isotope chemistry and modelling, but with the emphasis placed on their application to karst systems. Other techniques are specific to the karst environment, such as the speleological exploration of aquifers and water tracing. The various chapters of this book are written by experts in different methods. Most of the chapters are multi-authored, and the authors include hydrogeologists who are experienced in evaluating a variety of karst environments and who together, provide a comprehensive review of karst methods.
