Cardiac arrest can strike a seemingly healthy individual of any age, race, ethnicity, or gender at any time in any location, often without warning. Cardiac arrest is the third leading cause of death in the United States, following cancer and heart disease. Four out of five cardiac arrests occur in the home, and more than 90 percent of individuals with cardiac arrest die before reaching the hospital. First and foremost, cardiac arrest treatment is a community issue - local resources and personnel must provide appropriate, high-quality care to save the life of a community member. Time between onset of arrest and provision of care is fundamental, and shortening this time is one of the best ways to reduce the risk of death and disability from cardiac arrest. Specific actions can be implemented now to decrease this time, and recent advances in science could lead to new discoveries in the causes of, and treatments for, cardiac arrest. However, specific barriers must first be addressed. Strategies to Improve Cardiac Arrest Survival examines the complete system of response to cardiac arrest in the United States and identifies opportunities within existing and new treatments, strategies, and research that promise to improve the survival and recovery of patients. The recommendations of Strategies to Improve Cardiac Arrest Survival provide high-priority actions to advance the field as a whole. This report will help citizens, government agencies, and private industry to improve health outcomes from sudden cardiac arrest across the United States.

Catastrophic disasters occurring in 2011 in the United States and worldwide-

from the tornado in Joplin, Missouri, to the earthquake and tsunami in Japan, to

the earthquake in New Zealand-have demonstrated that even prepared

communities can be overwhelmed. In 2009, at the height of the influenza A

(H1N1) pandemic, the Assistant Secretary for Preparedness and Response at

the Department of Health and Human Services, along with the Department of

Veterans Affairs and the National Highway Traffic Safety Administration,

asked the Institute of Medicine (IOM) to convene a committee of experts to

develop national guidance for use by state and local public health officials and

health-sector agencies and institutions in establishing and implementing

standards of care that should apply in disaster situations-both naturally

occurring and man-made-under conditions of scarce resources. Building on the

work of phase one (which is described in IOM's 2009 letter report, Guidance

for Establishing Crisis Standards of Care for Use in Disaster Situations), the

committee developed detailed templates enumerating the functions and tasks of

the key stakeholder groups involved in crisis standards of care (CSC) planning,

implementation, and public engagement-state and local governments,

emergency medical services (EMS), hospitals and acute care facilities, and out-

of-hospital and alternate care systems. Crisis Standards of Care provides a

framework for a systems approach to the development and implementation of

CSC plans, and addresses the legal issues and the ethical, palliative care, and

mental health issues that agencies and organizations at each level of a disaster

response should address. Please note: this report is not intended to be a

detailed guide to emergency preparedness or disaster response. What is

described in this report is an extrapolation of existing incident management

practices and principles. Crisis Standards of Care is a seven-volume set:

Volume 1 provides an overview; Volume 2 pertains to state and local

governments; Volume 3 pertains to emergency medical services; Volume 4

pertains to hospitals and acute care facilities; Volume 5 pertains to out-of-

hospital care and alternate care systems; Volume 6 contains a public

engagement toolkit; and Volume 7 contains appendixes with additional

resources.
