The G-spot, Female Ejaculation, and Squirting. The G-spot plays a vital role in female ejaculation and squirting. Female ejaculation is when a girl or a woman ejaculate a thick, scanty, whitish, and milky fluid during sex or fingering. And Squirting is when the girl or woman gushes forth a clear fluid right before or during an orgasm. Both scenarios occur when the G-spot is persistently stroked.

Female ejaculate is a clear, watery liquid.

Its smell and taste vary with the cycle. It is

predominantly prostatic fluids mixed with

glucose and trace amounts of urine. After

the ejaculate is expelled from the female

prostate into the urethral canal, it can flow

either out to the urethral opening or into the

bladder.

### What Is Female Ejaculation And How To Do It? - Celine Remy

Okay everyone, it's time to talk about female ejaculation - because it's not as mysterious as many would like to believe.

Scientists have found evidence that women

who 'squirt' are expelling one of two

different types of liquid - one pure urine,

and the other a combination of urine and

fluid from the female prostate gland.

Often, female ejaculation is linked to manual stimulation of the g-spot, which can be accessed in the vagina, though it exists outside of it. The g-spot is actually the paraurethral glands, so in massaging or touching of these, which are under the vagina, it might stimulate a response of sudden production and expulsion of paraurethral fluid.

The first edition of FEMALE EJACULATION AND THE G-SPOT was

meant to raise awareness about the phenomenon of female ejaculation and to resurrect a now lost wonder and mystery surrounding this aspect of female sexuality.

Female ejaculation is characterized as an expulsion of fluid from or near the vagina during or before an orgasm. It is also known colloquially as squirting or gushing, although these are considered to be different phenomena in some research publications.
