Digital image processing, an integral part of microscopy, is increasingly important to the fields of medicine and scientific research. This book provides a unique one-stop reference on the theory, technique, and applications of this technology. Written by leading experts in the field, this book presents a unique practical perspective of state-of-the-art microscope image processing and the development of specialized algorithms. It contains in-depth analysis of methods coupled with the results of specific real-world experiments. Microscope Image Processing covers image digitization and display, object measurement and classification, autofocusing, and structured illumination. Key Features: Detailed descriptions of many leading-edge methods and algorithms In-depth analysis of the method and experimental results, taken from real-life examples Emphasis on computational and algorithmic aspects of microscope image processing Advanced material on geometric, morphological, and wavelet image processing, fluorescence, three-dimensional and time-lapse microscopy, microscope image enhancement, MultiSpectral imaging, and image data management This book is of interest to all scientists, engineers, clinicians, post-graduate fellows, and graduate students working in the fields of biology, medicine, chemistry, pharmacology, and other related fields. Anyone who uses microscopes in their work and needs to understand the methodologies and capabilities of the latest digital image processing techniques will find this book invaluable. TobakkoNacht -- The Antismoking Endgame, is a frontal attack on the

misuse of science and language to promote unjustified levels of smoking bans and taxes. The author, trained in statistics and propaganda analysis at Pennsylvania's Wharton School, "dissects" the scary antismoking studies that have made headlines over the past ten years. He shows clearly in each case how the data and language have been juggled to reach and promote the conclusions of those handing out the grant money and backs up his arguments with solid science clearly explained at a level that will satisfy both laymen and professionals. The book isn't all business though. It opens with a dystopian future tale of an "Endgame" in which the antismoking movement has gained full power and smokers are generally treated as near-criminals. The author explores the roots that could bring such a fiction into being and looks at the world that could be created... a very sad world indeed. The pseudo science used to push goals like outdoor smoking bans is also attacked with satire and with short essays taking the form of "Letters To The Editor" focusing on all the microarguments used by antismoking crusaders playing with their "scientific" instruments and by fanatic who'd happily apply the same methodology to reducing automobile and alcohol use. A few more formal communications showing how to approach local and national governmental bodies are also offered, again with the benefit of exposing false arguments while showing how to effectively attack the "authoritative sources" that seek to silence the opposition with their prestige while pushing for ever wider bans and ever higher taxes. The book concludes with a strong section painting a path toward a winning endgame for those in the Free Choice movement, pointing to the weaknesses of the current crop of smoking prohibitionists and suggesting how they can best be countered. TobakkoNacht can best be summed up like this: It shows how the denormalization of smokers has warped science and ripped holes in our social fabric while transforming a worthy public health effort into a

destructive social force assaulting our lives, our families, and our communities -- and it shows how to fight back!

Interest in brain connectivity inference has become ubiquitous and is now increasingly adopted in experimental investigations of

---

clinical, behavioral, and experimental neurosciences. *Methods in Brain Connectivity Inference through Multivariate Time Series Analysis* gathers the contributions of leading international authors who discuss different time series analysis approaches, providing a thorough survey of information on how brain areas effectively interact. Incorporating multidisciplinary work in applied mathematics, statistics, and animal and human experiments at the forefront of the field, the book addresses the use of time series data in brain connectivity interference studies. Contributors present codes and data examples to back up their methodological descriptions, exploring the details of each proposed method as well as an appreciation of their merits and limitations. Supplemental material for the book, including code, data, practical examples, and color figures is supplied in the form of a CD with directories organized by chapter and instruction files that provide additional detail. The field of brain connectivity inference is growing at a fast pace with new data/signal processing proposals emerging so often as to make it difficult to be fully up to date. This consolidated panorama of data-driven methods includes theoretical bases allied to computational tools, offering readers immediate hands-on experience in this dynamic arena.
