THE ANATOMY OF A BONY FISH
Ninety percent of all fish are bony fish, which are fish that have a skeleton made of bone. Bony fish include swordfish, tuna, flounder

and salmon. The gill cover, called an operculum, protects the gills. Water passes through the mouth and over the gills of the fish. As the water passes over the gills,

blooded animals that live in water and breathe using gills. Water goes in through the mouth and out through the gills, which take oxygen from the water. Most fish swim by moving their tail (also called the caudal fin) left and right. There are about

Fish Dissection Lesson Plan

In fish, the circulatory system is a single circuit, with a 2-chambered heart, unlike the typical 4-chambered heart found in land animals like mammals and birds. From the fish's atrium blood is pumped into the ventricle of the heart. From the ventricle, blood is pumped to the gills where gas exchange takes place in the gill filaments.

Anatomy: 1. Incision at anus. Begin by
inserting a fine scalpel blade into the anus (also
called the vent) of the fish. The anus is located
just anterior to (in front of) the anal fin, on the
ventral (lower) side of the fish in most fishes.
2. Cutting anteriorly.
