Framework agreements have
arisen in response to the well
documented and high costs of

public procurement procedures.
The agreements have
significant potential to improve
procedural efficiency in public
procurement, but are complex
to operate. Inadequate
preparation and
implementation can also
frustrate their potential both to
tackle waste, abuse and
corruption and to enhance
value for money. In this
enlightening book, Gian Luigi
Albano and Caroline Nicholas
look at the key decisions

required for designing and using framework agreements and address both legal and economic issues to give the reader a clear understanding of the planning, variables and flexibility needed for efficient implementation. This book will be of interest to policy makers, lawyers and public procurement practitioners who want to deepen their understanding of the legal and economic issues surrounding framework agreements.

Small Stocks, Big Money

This book examines the self-representation and identity politics of Private Military and Security Companies (PMSCs). PMSCs have become increasingly important over the past few decades. While their boom is frequently explained in functional terms, such as their cost-efficiency and effectiveness, this book

offers an alternative explanation based on an analysis of the online self-presentations of forty-two US- and UK-based companies. PMSCs are shaping how they are perceived and establishing themselves as acceptable and legitimate security actors by eclectically appropriating identities more commonly associated with the military, businesses and humanitarian actors. Depending on their audience and clients' needs, they can be professional hero warriors, or promise turn-key security solutions based on their exceptional expertise, or, in a similar way to humanitarians, reassure those in need of relief and try to make the world a better place. Rather than being merely public relations, the self-referential assertions of PMSCs are

political. Not only do they contribute to a normalization of private security and reinforce an already ongoing blurring of lines between the public and private sectors, they also change what we deem to be 'security' and a 'security actor'. This book will be of much interest to students of private military companies, critical security studies, military studies, security studies and IR.

Promoting gender equality at work is not only a matter of rights; it is the smart thing to do from the perspective of inclusive growth.

The Nordic region is a case in point, as it has come to represent the 11th largest economy in the world, not despite policy commitments to gender equality and social justice, but because of it. The Nordic countries have robust economies and good living conditions, where both women and men have high labour force participation rates. However, the gender pay gap is persistent and occupational segregation continues to hinder gender equality. The Nordic

What are we actually

talking about when we talk of flexibility in organizational settings? Do flexible forms of organization lead to varied, challenging and autonomous work or do they have a negative impact on working conditions? These questions are confronted by a group of specialist authors including Stephen Ackroyd, Harriet Bradley, Jan Ch. Karlsson, Philippe Moss é and Michael Rose, who discuss the concept of flexibility in relation to employment practices, organizational structure, cultural peculiarities and network arrangements in France, Italy, Norway, Sweden and the UK. While the question of workplace flexibility has been much debated in recent years, the main issues discussed have been the practice of non-standard forms of employment such as part-time work. This book is distinctive in dealing with flexibility related to organizational arrangements, organizational culture and network arrangements, and in assessing the combined effects of different arrangements in terms of manpower, structure, culture and networks on flexibility.

Complex systems is a new field of science studying how parts of a system give rise to the collective behaviors of the system, and how the system interacts with its environment. This book examines the complex systems involved in environmental sustainability, and examines the technologies involved to help mitigate human impacts, such as renewable energy, desalination, carbon

capture, recycling, etc. It considers the relationships and balance between environmental engineering and science, economics, and human activity, with regard to sustainability.

This report lays out the recommendations of the UN Millennium Project Task Force on Education and Gender Equality. In the education sector, the Task Force recommends that countries now off track expand access, overcome demand-side barriers, and implement institutional changes to make the education system more

A whole host of motivations are driving the development of the “renewables” industry—ranging from the desire to develop sustainable energy resources to the reduction of dangerous greenhouse gases that contribute to global warming. All energy

utilized on the earth is ultimately derived from the sun through photosynthesis—the only truly renewable commodity. As concerns regarding increasing energy prices, global warming and renewable resources continue to grow, so has scientific discovery into agricultural biomass conversion. Plant Biomass Conversion addresses both the development of plant biomass and conversion technology, in addition to issues surrounding biomass conversion, such as the affect on water resources and soil sustainability. This book also offers a brief overview of the current status of the industry and examples of production plants being used in current biomass conversion efforts. This book is the result of over ten (10) years of research and development in flexible robots and structures at Sandia National Laboratories. The authors decided to collect this wealth of knowledge into a set of viewgraphs in order to teach a graduate class in Flexible Robot Dynamics and Controls within the Mechanical Engineering Department at the University of New Mexico (UNM). These viewgraphs, encouragement from several students, and many late nights have produced a book that should provide an upper-level undergraduate and graduate textbook and a reference for experienced professionals. The content of this book

spans several disciplines including structural dynamics, system identification, optimization, and linear, digital, and nonlinear control theory which are developed from several points of view including electrical, mechanical, and aerospace engineering as well as engineering mechanics. As a result, the authors believe that this book demonstrates the value of solid applied theory when developing hardware solutions to real world problems. The reader will find many real world applications in this book and will be shown the applicability of these techniques beyond flexible structures which, in turn, shows the value of multidisciplinary education and teaming.
