In geology, numerical modeling is a widely applied technique to tackle complex geological problems by computational simulation of geological scenarios.. Numerical modeling uses mathematical models to describe the physical conditions of geological scenarios using numbers and equations. Nevertheless, some of their equations are difficult to solve directly, such as partial differential equations.

Thanks very much for the information. I am familiar with using the Reynolds number to determine the friction factor off the Moody diagram. My confusion is with the difference between f and $f_{\text{subscript-t}}$. In the text I use (Mott's Applied Fluid Mechanics), Darcy's formula is written as: $h_l = f \times L/D \times v^2/2g + f_t \times L_e/D \times v^2/2g$

What is a Transmission Flush? | Cost & Process

Fluid statics or hydrostatics is the branch of fluid mechanics

that studies "fluids at rest and the pressure in a fluid or

exerted by a fluid on an immersed body".. It encompasses the

study of the conditions under which fluids are at rest in stable

equilibrium as opposed to fluid dynamics, the study of fluids in motion. Hydrostatics are categorized as a part of the fluid statics, which is the ...
