Often the meanings of
words are changed subtly
for interesting reasons. The

implication of the word
'community' has changed
from including all the
organisms in an area to only
those species at a particular
trophic level (and often a
taxonomically restricted
group), for example, 'bird-
community'. If this
observation is correct, its
probable cause is the
dramatic growth in our
knowledge of the ecological
patterns along trophic levels
(I call these horizontal
patterns) and the processes
that generate them. This
book deals with vertical
patterns - those across
trophic levels -and tries to
compensate for their relative
neglect. In cataloging a
dozen vertical patterns I
hope to convince the reader
that species interactions
across trophic levels are as
patterned as those along
trophic levels and demand

explanations equally forcefully. But this is not the only objective. A limited number of processes shape the patterns of species interaction; to demonstrate their existence is an essential step in understanding why ecosystems are the way they are. To achieve these aims I must resort to both mathematical techniques to develop theories and statistical techniques to decide between rival hypotheses. The level of mathematics is likely to offend nearly everyone. Some will find any mathematics too much, while others will consider the material to be old, familiar ground and probably explained with a poor regard for rigour and generality.

This book explains what an ecosystem is and how the plants and animals within an ecosystem rely on and affect the ecosystem's existence. Different types of ecosystems are described, as well as the food webs within them. Through its presentation of how some changes to an ecosystem can be good while others are harmful, students discover the important role they can play in keeping ecosystems alive and well.

"Human impacts are dramatically altering our natural ecosystems. The implications of these human impacts on the sustainability and functioning of these amazingly complex entities remains

uncertain. As a result, food web theory has experienced a proliferation of research that seeks to address this critical area. This book synthesizes modern and classical results into a general theory. Finally, this book takes this general theoretical framework and discusses the implications of human impact for the stability and sustainability of ecological systems"--

Sterling Publishers Pvt. Ltd
Reflecting the recent surge of activity in food web research fueled by new empirical data, this authoritative volume successfully spans and integrates the areas of

theory, basic empirical research, applications, and resource problems. Written by recognized leaders from various branches of ecological research, this work provides an in-depth treatment of the most recent advances in the field and examines the complexity and variability of food webs through reviews, new research, and syntheses of the major issues in food web research. Food Webs features material on the role of nutrients, detritus and microbes in food webs, indirect effects in food webs, the interaction of productivity and consumption, linking cause and effect in food webs, temporal and spatial scales of food web dynamics, applications of food webs to pest management, fisheries, and ecosystem stress. Three

comprehensive chapters synthesize important information on the role of indirect effects, productivity and consumer regulation, and temporal, spatial and life history influences on food webs. In addition, numerous tables, figures, and mathematical equations found nowhere else in related literature are presented in this outstanding work. Food Webs offers researchers and graduate students in various branches of ecology an extensive examination of the subject. Ecologists interested in food webs or community ecology will also find this book an invaluable tool for understanding the current state of knowledge of food web research.

Feeding Relationships Letts and Lonsdale

Food webs are diagrams depicting which species interact or in other words, who eats whom. An understanding of the structure and function of food webs is crucial for any study of how an ecosystem works, including attempts to predict which communities might be more vulnerable to

disturbance and therefore in more immediate need of conservation. Although it was first published twenty years ago, Stuart Pimm's *Food Webs* remains the clearest introduction to the study of food webs.

Reviewing various hypotheses in the light of theoretical and empirical evidence, Pimm shows that even the most complex food webs follow certain patterns and that those patterns are shaped by a limited number of biological processes, such as population dynamics and energy flow. Pimm provides a variety of mathematical tools for unravelling these patterns and processes, and demonstrates their application through concrete examples. For this edition, he has written a new foreword covering recent developments in the study of

food webs and demonstrates their continuing importance to conservation biology.

This series has been completely revised to help pupils achieve the aims and objectives of the Primary Science syllabuses. All the books in the series help children to understand and enjoy science through activity-based learning. The series follows the process approach to develop the main scientific skills. Features include: lists the syllabus objectives at the beginning of each chapter highlights the process skill being developed in every chapter includes a wide variety of relevant activities encourages pupils to work in groups where appropriate gives clear instructions on safety includes summaries of key facts offers extra project work includes revision tests has a clear and attractive layout. There is also a handbook, *How to Teach Primary Science for the Caribbean*, written by the same author team, which contains an

explanation of the process approach to teaching, guidance on assessment and evaluation (including alternative approaches to assessment), and more.

Essential Examination Practice is a collection of revision questions that is designed to prepare students for the end-of-primary science examination. This has also been written by Raphael Douglass and Trevor Garcia. About the Authors Raphael Douglass is well known as a Science Educator in Trinidad and Tobago, and throughout the Caribbean. Trevor Garcia lectures in Education at Corinth Teachers' College in Trinidad.
