*Polymeric Nanofibers*

Springer Nature  
Polymeric

Nanofibers will showcase recent developments in the production, characterization, and emerging use of nanofibers made from different polymers for a variety of purposes.

Although it has been difficult to produce polymer fibers in the laboratory, electrospinning now makes it easier.

Electrospinning,

---

an electrohydrodynamic process for making thin polymer fibers with diameters in the range from around one nanometer to several thousands of nanometers, is simple and cost effective. Interest in other specialized routes to polymer nanofibers, including chemical synthesis, conventional textile fiber spinning, gas blowing, and other methods has been stimulated by the recent progress in electrospinning. Scientists and engineers in fields

such as filtration, biomaterials, biomedical devices, chemical analysis, catalysis, aerospace, fiber reinforced composites, energy conversion, protective clothing, agriculture, and others can produce experimental quantities of nanofibers in their own laboratories, from a wide variety of polymers of interest to them. The number of papers and patents in electrospinning has grown at a rapid rate during the past decade, more than

doubling each year since 1999. *Honda Accord 1994-1997* American Chemical Society This book presents the first comprehensive compilation of genome research on the Hevea brasiliensis rubber tree. The genomes of Hevea tree clones (cultivars) are described by three major international groups. Chapters on omics-driven investigations address a broad range of topics including genome annotation and utilisation, transcriptome and gene family analysis, genetic mapping, metabolic pathways in latex and molecular

breeding. Additionally, an overview of fundamental rubber biology, especially on laticifers, provides a historical background that is relevant to rubber genome analysis. The book concludes with several perspectives on the future needs of rubber investigations and prospects of rubber genomics. Given the scope of topics, this book will appeal to researchers and university students working in genomics and biotechnology of the rubber tree, and to rubber breeders with an interest in non-conventional approaches to trait analysis, selection and breeding.
