Matching DNA samples from crime scenes and suspects is rapidly becoming a key source of evidence for use in our justice system. DNA Technology in Forensic Science offers recommendations for resolving crucial questions that are emerging as DNA typing becomes more widespread. The volume addresses key issues: Quality and reliability in DNA typing, including the introduction of new technologies, problems of standardization, and approaches to certification. DNA typing in the courtroom, including issues of population genetics, levels of understanding among judges and juries, and admissibility. Societal issues, such as privacy of DNA data, storage of samples and data, and the rights of defendants to quality testing technology. Combining this original volume with the new update--The Evaluation of Forensic DNA Evidence--provides the complete, up-to-date picture of this highly important and visible topic. This volume offers important guidance to anyone working with this emerging law enforcement tool: policymakers, specialists in criminal law, forensic scientists, geneticists, researchers, faculty, and students.

Through the lens of cognitive science, *Jokes and the Linguistic Mind* investigates jokes that play on some aspect of the structure and function of language. In so doing, Debra Aarons shows that these 'linguistic jokes' can evoke our tacit knowledge of the language we use. Analyzing hilarious examples from movies, plays and books, *Jokes and the Linguistic Mind* demonstrates that tacit linguistic knowledge must become conscious for linguistic jokes to be understood. The book examines jokes that exploit pragmatic, semantic, morphological,

phonological and semantic features of language, as well as jokes that use more than one language and jokes that are about language itself. Additionally, the text explores the relationship between cryptic crossword clues and linguistic jokes in order to demonstrate the difference between tacit knowledge of language and rules of language use that are articulated for a particular purpose. With its use of jokes as data and its highly accessible explanations of complex linguistic concepts, this book is an engaging supplementary text for introductory courses in linguistics, psycholinguistics and cognitive science. It will also be of interest to scholars in translation studies, applied linguistics and philosophy of language.

From the bestselling author of the acclaimed *Chaos and Genius* comes a thoughtful and provocative exploration of the big ideas of the modern era: Information, communication, and information theory. Acclaimed science writer James Gleick presents an eye-opening vision of how our relationship to information has transformed the very nature of human consciousness. A fascinating intellectual journey through the history of communication and information, from the language of Africa's talking drums to the invention of written alphabets; from the electronic transmission of code to the origins of information theory, into the new information age and the current deluge of news, tweets, images, and blogs. Along the way, Gleick profiles key innovators, including Charles Babbage, Ada Lovelace, Samuel Morse, and Claude Shannon, and reveals how our understanding of information is transforming not only how we look at the world, but how we live. An argument that what makes science distinctive is its emphasis on evidence and scientists' willingness to change theories on the basis of new evidence.

Attacks on science have become commonplace. Claims that climate change isn't settled science, that evolution is "only a theory," and that scientists are conspiring to keep the truth about vaccines from the public are staples of some politicians' rhetorical repertoire. Defenders of science often point to its discoveries (penicillin! relativity!) without explaining exactly why scientific claims are superior. In this book, Lee McIntyre argues that what distinguishes science from its rivals is what he calls "the scientific attitude"—caring about evidence and being willing to change theories on the basis of new evidence. The history of science is littered with theories that were scientific but turned out to be wrong; the scientific attitude reveals why even a failed theory can help us to understand what is special about science. McIntyre offers examples that illustrate both scientific success (a reduction in childbed fever in the nineteenth century) and failure (the flawed "discovery" of cold fusion in the twentieth century). He describes the transformation of medicine from a practice based largely on hunches into a science based on evidence; considers scientific fraud; examines the positions of ideology-driven denialists, pseudoscientists, and "skeptics" who reject scientific findings; and argues that social science, no less than natural science, should embrace the scientific attitude. McIntyre argues that the scientific attitude—the grounding of science in evidence—offers a uniquely powerful tool in the defense of science.

"Archaeology: The Basics, rewritten for this fourth edition, is a short, engaging book takes the reader on a journey through the fascinating world of archaeology and archaeologists. Written in a

non-technical style by two experienced archaeologists and writers about the past, the book begins by introducing archaeology as a unique way of studying the entire span of the human past from our origins some 6 million years ago to today. The authors stress that archaeology is a global study of human biological and cultural diversity. After a brief look at early archaeological discoveries, they introduce today's multidisciplinary archaeology. Then they go on to describe the archaeological record, the archives of the past and the importance of contexts of time and space. How do we find archaeological sites and how do we explore them? Two chapters laced with examples examine these questions. Later chapters describe ancient technologies and how we study them, also the all-important subject of changing ancient environments and climate change. Zooarchaeology, flotation methods, and other ways of reconstructing ancient diet and subsistence lead us into the study of changing settlement patterns across the landscape. Next, they visit the people of the past, either as individuals or groups, calling on bioarchaeology to assist them. Two chapters discuss ancient culture change and the remarkable diversity of ancient societies and they are followed by an exploration of the spiritual realm, the exploration of the intangible. The final chapter looks at the importance of archaeology in today's world. Rich in numerous examples and contemporary thinking about archaeology, this book tries to answer an important question: What does archaeology tell us about ourselves? Archaeology: The Basics is essential reading for all those beginning to study archaeology and anyone who has ever questioned the past"--

A deeply-reported, riveting account of a cold case murder in Los Angeles, unsolved until DNA evidence implicated a shocking suspect — a female detective within the LAPD's own ranks. On February 24, 1986, 29-year-old newlywed Sherri Rasmussen was murdered in the home she shared with her husband, John. The crime scene suggested a ferocious struggle, and police initially assumed it was a burglary gone awry. Before her death, Sherri had confided to her parents that an ex-girlfriend of John's, a Los Angeles police officer, had threatened her. The Rasmussens urged the LAPD to investigate the ex-girlfriend, but the original detectives only pursued burglary suspects, and the case went cold. DNA analysis did not exist when Sherri was murdered. Decades later, a swab from a bite mark on Sherri's arm revealed her killer was in fact female, not male. A DNA match led to the arrest and conviction of veteran LAPD Detective Stephanie Lazarus, John's onetime girlfriend. The Lazarus Files delivers the visceral experience of being inside a real-life murder mystery. McGough reconstructs the lives of Sherri, John and Stephanie; the love triangle that led to Sherri's murder; and the homicide investigation that followed. Was Stephanie protected by her fellow officers? What did the LAPD

know, and when did they know it? Are there other LAPD cold cases with a police connection that remain unsolved?

Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

This book will introduce the field of forensic semiotics as a tool for understanding crime and criminality. It will focus on how symbolism, ritual, and other sign-based activities play a crucial role in the constitution of criminal organizations and often in the enactment of individual crimes. It will present semiotic notions, methods, and techniques that can be applied to forensic science, such as the role of ritual and slang in criminal gangs.

### Forensic Toxicology The Thief of Sacred

When it comes to science, too often people say "I just don't have the brains for it" -- and leave it at that. Why is science so intimidating, and why do people let themselves feel this way? What makes one person a scientist and another disinclined even to learn how to read graphs? The idea that scientists are people who wear lab coats and are somehow smarter than the rest of us is a common, yet dangerous, misconception that puts science on an intimidating pedestal. How did science become so divorced from everyday experience? In Eureka, science popularizer Chad Orzel argues that even the people who are most forthright about hating science are doing science, often without even knowing it. Orzel shows that science is central to the human experience: every human can think like a scientist, and regularly does so in the course of everyday activities. The common misconception is that science is a body of (boring, abstract, often mathematical) facts. In truth, science is a process: Looking at the world, Thinking about what makes it work, Testing your mental model by comparing it to reality, and Telling others about your results -- all things that people do daily. By revealing the connection between the everyday activities that people do -- solving crossword puzzles, playing sports, or even watching mystery shows on television -- and the processes used to make great scientific discoveries, Eureka shows that this process is one everybody uses regularly, and something that anyone can do.
