A Course in Discrete Structures
Theoretical Computer Science is mathematical and abstract in spirit, but it derives its motivation from practical and everyday computation. Its aim is to understand the nature of computation and, as a consequence of this understanding, provide more efficient methodologies. All papers introducing or studying mathematical, logic and formal concepts

and methods are welcome, provided that their ...

INTRODUCTION TO Automata Theory, Languages, and Computation

A cellular automaton is a collection of

"colored" cells on a grid of specified shape that evolves through a number of discrete time steps according to a set of rules based on the states of neighboring cells. The rules are then applied iteratively for as many time steps as desired. von Neumann was one of the first people to consider such a model, and incorporated a cellular model into his ...

A programming language is a formal language, which comprises a set of instructions that

produce various kinds of output. Programming languages are used in computer programming to implement algorithms.. Most programming languages consist of instructions for computers. There are programmable machines that use a set of specific instructions, rather than general programming languages.
