The purpose of this design manual is to provide restoration practitioners with guidelines for implementing a subset of low-tech tools--namely beaver dam analogues (BDAs) and post-assisted log structures (PALS)--for initiating process-based restoration in structurally-starved riverscapes. While the concept of process-based

restoration in riverscapes has been advocated for at least two decades, details and specific examples on how to implement it remain sparse. Here, we describe 'low-tech process-based restoration' as a practice of using simple, low unit-cost, structural additions (e.g. wood and beaver dams) to riverscapes to mimic functions and initiate specific processes. Hallmarks of this approach include: - An explicit focus on the processes that a low-tech restoration intervention is meant to promote.- A conscious effort to use cost-effective, low-tech treatments (e.g., hand-built,

natural materials, non-engineered, short-term design life-spans) because of the need to efficiently scale-up application.- 'Letting the system do the work', which defers critical decision making to riverscapes and nature's ecosystem engineers.

Anyone who has spent serious time outdoors knows that in survival situations, wild plants are often the only sustenance available. The proper identification of these plants can mean the

difference between survival and death. This book describes habitat and distribution, physical characteristics, and edible parts of wild plants—the key elements of identification. Hugely important to the book are its color photos. There are over one hundred of them, further simplifying the identification of poisonous and edible plants. No serious outdoors person should ever hit the trail without this book and the knowledge contained within it.
