Does the identification number 60 indicate a toxic substance or a flammable solid, in the molten state at an elevated temperature? Does the identification number 1035 indicate ethane or butane? What is the difference between natural gas transmission

pipelines and natural gas distribution pipelines? If you came upon an overturned truck on the highway that was leaking, would you be able to identify if it was hazardous and know what steps to take? Questions like these and more are answered in the Emergency Response Guidebook. Learn how to identify symbols for and vehicles carrying toxic, flammable, explosive, radioactive, or otherwise harmful substances and how to respond once an incident involving those substances has been identified. Always be prepared in situations that are unfamiliar and dangerous and know how to rectify them. "The CSP Exam - Essential Practice by Farcas, Hammond, and Cena is, as the name implies, an essential set of questions in Occupational

Safety. This book is well laid out in 19 sections. It draws the reader in, which certainly assists with their increased retention of the amount of material that has to be covered. The questions are well introduced with a short narrative before the introduction of the pertinent equations and solution to the over 600 example essential questions. The book serves not only as a formidable preparation for the CIH exam but a good review of basic principles, a reference for many of the day-to-day technical issues confronting the practicing worker's safety and a guide for raising awareness of potential problems for which alert action is required. The authors bring a breadth of experience and insight into the issues handled in the text. They bring context to the basic principles to be highlighted by the examples of the questions and their solutions. CSP Exam - Essential Practice should be a must-have text for everyone in the field."Michael McCawley, Ph.D., West Virginia University.

Because crystalline silica forms the common mineral quartz as well as less common minerals and because the Hazard Communication Standard affects production and use of many mineral commodities, it is important to understand what crystalline silica is and is not, where it is found and used, and how it is qualitatively and quantitatively identified. This publication addresses these issues. Chapter 1 describes what crystalline silica is and how we come in contact with it. Chapter 2 discusses the regulatory decisions that have created new interest in

this widespread substance and presents an overview of the techniques used to determine the presence and abundance of crystalline silica. A list of selected readings and other resources is included. The detailed glossary that defines many terms beyond the scope of this publication will further help the reader.

A large number of chemicals are used on land at shore facilities, in the air in combat and reconnaissance aircraft, on seas around the world in surface vessels, and in submarine vessels by the navy and marine corps. Although the chemicals used are for the large part harmless, there is a significant amount of chemicals in use that can be health hazards during specific exposure circumstances. The Navy Environmental Health Center (NEHC) is primarily tasked with assessing these hazards. The NEHC completes its tasks by reviewing toxicological and related data and preparing health-hazard assessments (HHAs) for the different chemicals. Since the NEHC is continually asked to develop these HHAs, the National Research Council (NRC) was asked to assess independently the validity and effectiveness of NEHC's HHA process, in order to determine whether the process as implemented provides the Navy with the best, comprehensive, and defensible evaluations of health hazards and to identify any elements that might require improvement. The task was assigned to the Board on Environmental Studies and Toxicology's Committee on Toxicology's (COT's) Subcommittee on Toxicological hazard and Risk Assessment. Review of the U.S. Navy Environmental

Health Center's Health-Hazard Assessment Process presents the subcommittee's report. The report is the work of expertise in general toxicology, inhalation toxicology, epidemiology, neurotoxicology, immunotoxicology, reproductive and developmental toxicology, pharmacology, medicine, risk assessment, and biostatistics. It is based on its review of documents provided by NEHC, presentations by NEHC personnel, and site visits to NEHC in Norfolk, Virginia and an aircraft carrier in San Diego, California.
