Functional decomposition is a way of breaking down the complex problem into simpler problems based on the tasks that need to be performed rather than the the data relationships. This term is usually associated with the older procedure-oriented design. A short description about the difference between procedure-oriented and object-oriented design.

## Functional decomposition - Wikipedia

The process decomposition diagram (often called a decomp) explains the breakdown of processes within a project or business area or functional area. The purpose is to show all the processes and identify relationships and dependencies among them. Note that a decomp doesn't drill into the how; it merely outlines the what.

Functional decomposition is a rather grandiose and pretentious term for breaking the problem down into smaller more easily solved problems. In this article I'd like to cover how spending time doing this, if needed twice (once after the initial requirements acceptance, and then again at the time of feature design) has benefits.

Functional decomposition of engineering systems is a method for analyzing engineered systems. The basic idea is to try to divide a system in such a way that each block of the block diagram can be described without an "and" or "or" in the description. This exercise forces each part of the system to have a pure function.

The functional decomposition is the depiction of the functions that will be achieved by a system. The functional decomposition is laid out in a hierarchical fashion. At the top of the decomposition is the general function of what is to be accomplished by the system. At the second level are the main functions of what is to be

accomplished.

## Functional Decomposition - SourceMaking

Functional Decomposition can be achieved by using a Requirements diagram to create a hierarchy of system features. A system Feature is a good way to capture the high level capabilities of a system, and these can be broken down to a number of levels using a tree structure created with an Aggregation or Composition Relationship.
