Portals present unique strategic challenges in the academic environment. Their conceptualization and design requires the input of campus constituents who seldom interact and whose interests are often opposite. The implementation of a portal requires a coordination of applications and databases controlled by different campus units at a level that may never before have been attempted at the institution. Building a portal is as much about constructing intra-campus bridges as it is about user interfaces and content. Designing Portals: Opportunities and Challenges discusses the current status of portals in higher education by providing insight into the role portals play in an institution's business and educational strategy, by taking the reader through the processes of conceptualization, design, and implementation of the portals (in different stages of development) at major universities and by offering insight from three producers of portal software systems in use at institutions of higher learning and elsewhere.

This new book from the National Research Council finds serious weaknesses in the government's plan for research on the potential health and environmental risks posed by nanomaterials, which are increasingly being used in consumer goods and industry. An effective national plan for identifying and managing potential risks is essential to the successful development and public acceptance of nanotechnology-enabled products. The book recommends a robust national strategic plan for addressing nanotechnology-related EHS risks, which will need to focus on promoting research that can assist all stakeholders, including federal agencies, in planning, controlling, and optimizing the use of engineered nanomaterials while minimizing EHS effects of concern to society. Such a plan will ensure the timely development of engineered nanoscale materials that will bring about great improvements in the nation's health, its environmental quality, its economy, and its security.

Protected areas can be found in a wide variety of environments, ranging from mountains to the sea, deserts, forests and freshwater lakes, and even traverse borders. They differ in almost every respect, including the purposes for which they are managed, their size, the types of sites and resources they protect, and their management. In recent decades, the number of protected areas has increased rapidly. Although, there has been good progress in expanding the coverage of terrestrial protected areas 14.9%, the further areas are needed for a full representation of areas of particular importance for biodiversity and ecosystem services (UNEP-WCMC, IUCN and NGS, 2018). In general, this rapid and recent growth in protected areas has not been accompanied by commensurate expansion in management capacity. The designation of protected status both on land and water has often failed to resolve (and in some cases has heightened) conflicts over access, use or control of the areas concerned. Economic recession and hardship have thrown such issues into sharper focus in recent years. Protected areas will not survive unless they enjoy broad public support, which is dependent on

people's fundamental needs being met. Land use and resource management conflicts, inequities or impacts do not cease to exist simply because an area is granted protected status. When established by nation states or related entities, protected area boundaries often reflect considerations of sovereignty, governance and tenure as much as the environment types they seek to protect. For all these reasons, the planning and management of protected areas must be coordinated with the use and management of other areas rather than treated in isolation. The long-term success of protected areas must be framed by the search for more sustainable patterns of development in general. The present Guidelines are intended to support the establishment process for protected areas.
