This Second Edition of Family Medicine: Principles and Practice presents a scientific approach to health and illness in the context of mankind's most enduring societal unit-the family. This is a new book, building on the strengths of the First Edition. The emphasis of this book,

like that of the specialty itself, is on the clinical delivery of health care; that is, how the practitioner manages common problems and recognizes uncommon entities encountered in office, hospital, home, and nursing home. In the First Edition, we were faced with the problem of how to organize a family medicine textbook that dealt with clinical topics yet represented more than a series of essays on the specialties for the generalist reader. We began by identifying specific objectives, outlined in the preface to the First Edition. From this evolved an approach which has been called the biopsychosocial perspective-inclusion of behavioral, family, social, and cultural aspects of health care integrated with the traditional "manifestations-and-management" textbook model. The First Edition also introduced a comprehensive classification of clinical problems in family medicine now used in curriculum planning in many family practice residency programs.

A text that truly embodies its name, CHEMISTRY: PRINCIPLES AND PRACTICE connects the chemistry students learn in the classroom (principles) with real-world uses of chemistry (practice). The authors accomplish this by starting each chapter with an application drawn from a chemical field of interest and revisiting that application throughout the chapter. The Case Studies, Practice of Chemistry essays, and Ethics in Chemistry questions reinforce the connection of chemistry topics to areas such as forensics, organic chemistry, biochemistry, and industry. An Introduction to the principles of physical chemistry from the standpoint of modern atomistics and thermodynamics E3 Scholastic Publishing

This presentation describes various aspects of the regulation of tissue oxygenation, including the roles of the circulatory system, respiratory system, and blood, the carrier of oxygen within these components of the cardiorespiratory system. The respiratory system takes oxygen from the atmosphere and transports it by diffusion from the air in the alveoli to the blood flowing through the pulmonary capillaries. The cardiovascular system then moves the oxygenated blood from the heart to the microcirculation of the various organs by convection, where oxygen is released from hemoglobin in the red blood cells and moves to the parenchymal cells of each tissue by diffusion. Oxygen that has diffused into cells is then utilized in the mitochondria to produce adenosine triphosphate (ATP), the energy currency of all cells. The mitochondria are able to produce ATP until the oxygen tension or PO₂ on the cell surface falls to a critical level of about 4–5 mm Hg. Thus, in order to meet the energetic needs of cells, it is important to maintain a continuous supply of oxygen to the mitochondria at or above the critical PO₂. In order to accomplish this desired outcome, the cardiorespiratory system, including the blood, must be capable of regulation to ensure survival of all tissues under a wide range of circumstances. The purpose of this presentation is to provide basic information about the operation and regulation of the cardiovascular and respiratory systems, as well as the properties of the blood and parenchymal cells, so that a fundamental understanding of the regulation of tissue oxygenation is achieved.
