The Calvin Cycle occurs during photosynthesis and consists of light independent redox reactions that convert carbon dioxide into glucose. This conversion happens in the chloroplast, or more specifically the stroma of the chloroplast. The chloroplast region is an area between the thylakoid membrane and the inner membrane of the organelle which is typically located in the leaves of plants.

### General Biology Second Semester Study

Second Semester Review Are animals autotrophs or heterotrophs? Explain. What type of symmetry does a sea anemone have? At which end of an animal is the tail located? What supportive rod along the back do all chordates have at some time during their life? How do sponges differ from all other animals? How ... Continue reading "Second Semester Study Guide BI"
