Laboratory Manual for General, Organic, and Biological Chemistry can accompany the lab portion of any one-semester GOB chemistry course. Most experiments include a link to the health sciences, such as nursing and nutrition, while concepts are framed in real-world questions and are broadly applicable. Many of the experiments illustrate concepts from more than one chapter of the text and often utilize basics from the areas of general, organic, or biological chemistry to develop concepts in one or more of the other areas. This integrated strategy helps students to understand that

chemistry is not a disparate set of unrelated concepts. Using this integrated approach, students develop the skills to help them understand chemistry and to see its applications in their everyday lives.

Nanotechnology is a vital new area of research and development addressing the control, modification and fabrication of materials, structures and devices with nanometre precision and the synthesis of such structures into systems of micro- and macroscopic dimensions. Future applications of nanoscale science and technology include motors smaller than the diameter of a human hair and single-celled organisms programmed to fabricate materials with nanometer precision. Miniaturisation has revolutionised the semiconductor industry by making possible inexpensive integrated electronic circuits comprised of devices and wires with sub-micrometer dimensions. These integrated circuits are now ubiquitous, controlling

everything from cars to toasters. The next level of miniaturisation, beyond sub-micrometer dimensions into nanoscale dimensions (invisible to the unaided human eye) is a booming area of research and development. This is a very hot area of research with large amounts of venture capital and government funding being invested worldwide, as such Nanoscale Science and Technology has a broad appeal based upon an interdisciplinary approach, covering aspects of physics, chemistry, biology, materials science and electronic engineering. Kelsall et al present a coherent approach to nanoscale sciences, which will be invaluable to graduate level students and researchers and practising engineers and product designers.

The Chemical News

Green chemistry involves designing novel ways to create and synthesize products and implement processes that will eliminate or greatly reduce negative environmental impacts. The Green Chemistry Laboratory Manual for General Chemistry provides educational laboratory materials that challenge students with the customary topics found in a general chemistry laboratory manual, while encouraging them to investigate the practice of green chemistry. Following a consistent format, each lab experiment begins with objectives and prelab

questions highlighting important issues that must be understood prior to getting started. This is followed by detailed step-by-step procedures for performing the experiments. Students report specific results in sections designated for data, observations, and calculations. Once each experiment is completed, analysis questions test students' comprehension of the results. Additional questions encourage inquiry-based investigations and further research about how green chemistry principles compare with traditional, more hazardous experimental methods. By placing the learned concepts within the larger context of green chemistry principles, the lab manual enables students to see how these principles can be applied to real-world issues. Performing laboratory exercises

through green experiments results in a safer *Chemistry* learning environment, limits the quantity of hazardous waste generated, and reduces the cost for chemicals and waste disposal.

Students using this manual will gain a greater appreciation for green chemistry principles and the possibilities for future use in their chosen careers.
