When a historic battlefield site is discovered and studied, the focus is often on the “hardware” : remnants of weaponry, ammunition, supplies, and equipment that archaeologists carefully unearth,

analyze, conserve, and frequently place on display in museums. But what about the “software” ? What can archaeology teach us about the humans involved in the conflict: their social mores and cultural assumptions; their use and understanding of power? In *The Archaeology of Engagement: Conflict and Revolution in the United States*, Dana L. Pertermann and Holly K. Norton have assembled a collection of studies that

includes sites of conflicts between groups of widely divergent cultures, such as Robert E. Lee's mid-1850s campaign along the Concho River and the battles of the River Raisin during the War of 1812. Notably, the second half of the book applies the editors’ principles of conflict event theory to the San Jacinto Battlefield in Texas, forming a case study of one of America's most storied—and heavily trafficked—battle sites. The Woodlawn orebody is located in eastern New South Wales, Australia. It is one of an important class of massive, copper-lead-zinc, stratiform volcanogenic mineral deposits and has reserves of about 10 million tonnes of ore. Deposits such as Woodlawn are the object of considerable worldwide exploitation effort because they yield the highest rate of return on mining investment with modest capital requirements. This detailed geophysical case study contains individual contributions by professionals from diverse backgrounds (industry, government and university) and includes the latest geophysical methods. It is the

only detailed geophysical study of an economic sulphide deposit ever undertaken for educational purposes

"Field measurements with the EM16 instrument, in several areas definitely confirm the usefulness of the VLF method for mapping shallow

Papers: 1) The theory of EM surface wave impedance measurements; 2) Radiohm mapping of permafrost; 3) Mapping bedrock terrain with the EM16R-VLF unit; 4) Interpretation of single frequency VLF data; 5) Wave impedance measurement at 60 kHz; 6) Inversion of VLF data for simple lateral inhomogeneities; 7) Magnetotelluric phase measurements; 8) Instrumentation of direct measurement of phase of audio-frequency magnetotellurics. Current Research Geophysical measurements are not done for the sake of art only. The ultimate goal is to solve some well-defined geological, tectonical or structural problems. For this purpose, the data have to be interpreted, translated, into a physical model of the subsurface. ... This book describes some of the most important common features of different geophysical data sets. In hard rock terrain, shallow water wells generally have a poor to moderate yield. Sinking wells deeply to tap yielding fracture zones often backfires, because the borehole may miss the saturated fracture zones at depths. A wrong approach to groundwater exploration in hard rock has therefore

often led to unnecessary recurring expenditures and waste of time, something that could have been avoided by a systematic and proper geophysical approach. The combination of various geophysical techniques with environmental conditions is essential to constrain the

interpretation and reduce uncertainties in this respect. This book presents the approach to groundwater exploration in hard rocks, various geophysical techniques and combinations to be used, interpretation of data with case studies and drilling results and the preparation
